WELCOME to TheFred and KU4A!

Why not hit the "reply" button (hey with the new format, YAHOO switched them around so be careful you don't delete me, har...) and tell us about yourselves and your stations guys.

73!

Bill K0ZL

I'm Fred K2FRD, first licensed in 1961. I'm a Kenwood fan and joined this list because my TS-520 has proven to be a hard-working durable rig. It's only shortcoming is that it doesn't cover the WARC bands, so I use it for backup to my TS-50. I do a LOT of portable operations including all of summer 2001 on a personal DXpedition to VO2 Labrador. However, I've used my 520 on several JOTAs (Scout Jamboree On The Air) working off either a generator or my car battery (the 6146s will drain a battery in less than two hours).

QTH is Guilford, Chenango County, upstate New York, where the closest landmark is Cooperstown (Baseball Hall of Fame), about 40 radio miles ENE.

I use Eudora Pro 5.1 on my Mac 7300/G3/400, so I don't have Yahoo's email window; since Eudora isn't a web-based emailer, when I delete, I can still recover messages.

I've done a complete rearrange of my living room shack and plan to fire up the 520 soon, just to keep the contacts from corroding and keep my mind refreshed on loading tube rigs.

More details on my little adventures are in the links below.

Looking forward to hearing good things on this list.

73 de Fred
K2FRD

Hello all, I am Mike (KU4ZD) and my first contact as (KA0JAW) was on July 22, 1980 at 16:45 with KA8HUN, Don in Ohio. I have been active in many midwest states and Florida over the years.

I am active in most of the modes including ATV, SSTV, Satellite, HF, UHF, VHF, APRS, Digital and many more. Also I am a very active SWL and scanning buff. I support ARES, RACES, Skywarn, MARS and am a member of two local ham clubs, a area scanner club and the ARRL.

I am a Kenwood fan, still running two 520's (one SE and one S) with TV-502 and TV-506 Transverters, Matching speakers, DG-5 Digital displays, MC-50 mics and VFO.

I have set up a page where you can see pictures of and get a list of my equipment as well as a lot of other information on my station. It is in the "Visit My Sack" section of my Website.

I just joined the group want and wanted to say hello, share a little information about my Kenwoods.

Hi Bill. Of course, you know me from the other clubs and our e-mail exchange, but I'll say a few words for those who don't know me.

My "ticket" to this club is a TS-520S and a TS-820 (note: 820 not 820S - mine does not have a digital display) that I purchased for my collection within the last year. The 520S is perfect as far as I know. The 820 has some intermittents on transmit that we have talked about before. I promise I will work on it RSN (real soon now :-)). It works pretty well most of the time. I suspect it has been exposed to cigarette smoke.

I'm keeping an eye out for a 530, 830 and/or accessories for any of these. KU4ZD if you ever decide to sell any of your transverters, let me know ;-).

By the way, Bill, if you are interested in expanding the list of excellent clubs you moderate, I also have an Icom IC-745, TenTec Argonaut 509 and Atlas 210X, that, as far as I know, aren't covered by any existing clubs :-). There are clubs for my other gear (IC-706, TS-440S, Drakes, etc.).

73 to all

Hi Chris, thanks for introducing yourself!

As for the other rigs not covered by a Yahoo club, be my guest! It's not hard to set up a new club, and moderating them only takes about ten minutes a day max.

The intermittants on the 820; try cleaning the T/R relay contacts. Cig smoke does a number on them; also take the VCO/DIVIDER ass'ys apart and spray CaiLube on the betwixt-board stake connectors, and re-assemble. That usually cures it.

Also check your bandswitch shaft coupling inside the final tank enclosure; if it is cracked, the bandswitch won't index properly and some bands will be intermittant.

FB on the "cailube", but if you use the Caig Labs "DeoxIT" and finish up
with their "PreserveIT" the cleaning job will last much longer.
Here in Hawaii we have the heat and dampness that causes these type
contacts to oxidize quite fast. One of the locals was cleaning his at
least once a month before Caig. I've used it extensively (I have 3ea
TS-820S) and can safely say the solution is a keeper.

Thanks will try that... worst is the controls in the
vintage car radios!

I have some DeOxit but need to get some Preserveit
too. With the demise of Radioshack.com, I am reduced
to ordering this stuff online (this, in a major city
like Denver!).

Nigel,

Thanks for joining and for your first post! That is
great.

The 530 is a great rig! Has all the flavor and charm
of the 520, plus digital readout and warc bands, no?

There are many hams who still prefer the
520/530/820/830 over the current offerings, whether
because of pricing, fondness of glow-bugs or just
wanting a rig with real knobs that tune things.. each
one has his reasons!

I chose to combine four models into one list, because
they share many characteristics, circuits and
problems, and they all have that classic Kenwood look.

Hello all,

Having having recently obtained a TS-530S in very good condition. I am very pleased with the results so far to say that my Yaesu FT757GX has been placed back in its packing box ! The receiver sensitivity and the quality of the audio seems to knocks spots off the FT757GX.

I would be interested to hear from any one who has had any past experience with the optional IF filters or TS-530S in general. I tend to sit on the 40m band and although the TS-530S doesnt come fitted with a notch or variable IF filter I wondered if the narrower 1.8khz ssb filter is actually worth the money?.

Any thoughts or suggestions?

Thanks.

I would not go with the narrow filter on the 530,
rather might try some out board DSP noise reducer.
Reason being, 75-40m just doesnt' sound good through
narrow SSB filter because of all the atmospheric
noise. It causes a narrow filter to ring
unpleasantly, and it will fatigue you after a while.

Thank you very much for your advice bill.

For those of you who have a TS-830 the following web page might be of some use, I stumbled across this page this morning which covers "Circuit Improvements and Maintenance Procedures for the TS-830S" by Richard L. Measures, AG6K.

The url is http://www.vcnet.com/measures/830.html

Perhaps one for the bookmarks, I hope it is useful to someone.

Rich has some great mods and repair tips, I have used
many of them.

Thanks for the response, Bill, and hello to all. I've used a TS-820S for better than 15 years now and still runs as good as the day I purchased it and I believe I'm the 3rd owner. Only plagued occasionally with that common LED display problem. Too lazy to go in and clean it up. Still putting out max power and still get good reports even though my antenna is a 4-band Spider on a camera tripod(those stinkin' CC&R's, you know). I'd really like an 830 for the extra bands but found an ICOM 706 that I'm really enjoying also. Amazing what they're putting in small packages these days!
The rest of the station consists of a R.S. HTX-10(2), HTX-252 and HTX-245. I've been mobile with one of the 10m's but removed it after selling that vehicle. I'm planning on re-installing in another vehicle and work 10m till it dies for this cycle. Maybe run the 706 mobile also. QTH here is Chandler, Az. 85248.
Looking forward to chatting with other TS-5???/8??? lovers for their experiences. Also like to hear about antenna experiences in CC&R(ugh!) restricted areas.
73's.

Thanks Rudy!

I love these old rigs.

The intermittant counter thing is easy to fix, hardest part is getting the PLL/VCO and counter modules out and back in. Just make notes of where the plug-in connectors go (I mark them with a "sharpie", "5", "6" etc) and don't loose any screws. A magnetized #2 Phillips screwdriver is all you need, along with a can of Cailube or other high-end cleaner.

I don't spray the connectors direcly, but use a foam-tipped applicator (for tape head cleaning, etc) and spray the applicator, then get all sides of the square connector pins. Then you just put the board back in the small chassis, pull it out, wipe the pins again, and put it all back together.

20. TS-530S

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2002-09-02 20:00:00 UTC
From: fiberkey
Topic: 20 Message: 20

Hello Gentlemen,

I am a new member of the group and have a TS-530S in mint condition. I am a EE from the tube era and bought the TS-530S as a "transition" radio to still have at least a tube final. Solid state for the rest is fine however I like to be able to adjust the pi-network and really fine tune the output.

I would like to relate a unique (I think) problem and fix that I hope will save some one with the same situation several hours.

The TS-530S suddenly "crackeled" and lost all RF output on all bands. Drive in the ALC position was fine but plate current (Ip) would not dip on any band. All voltages on the 6146s were perfect. The ceramic plate coupling capacitor was also fine but the output tank could not be dipped with a grid dip meter. An ohmmeter showed everything connected properly (or so I thought)!

To make a long story short the problem turned out to be a cold solder joint on the plate tuning capacitor stator. Considering the guage of the stator and the wire (the heavy coil) it was amazing that this could become open. A soldering iron bubbled out the rosin and the rig was perfect after. This probably was an original factory defect that took 20 years to surface.

It just goes to show that you can't judge a connection by it's looks. Even heavy connections can fail.

Best regards to everyone in the group and I will look in from time-to-time.

By the way, I am also the author of "Math's Notes" for CQ Magazine (since 1970).

73, Irwin
WA2NDM

CONGRATS on the fix!

The key was the lack of resonance...

Thanks for the reply and procedure, Bill. I'll put it on my "duck" list. I also just purchased a Cushcraft MA5B mini-beam. Just wondering if anyone has any experience with this antenna(good reviews in e-Ham.net). Also looking for methods (masts, tripods, etc.) of getting this guy up in the air. Did I mention CC&R's?! Also trying to keep this antenna portable(tripod with wheels?) to move it around to confuse the HOA Nazi's! If this isn't the right place to post this just let me know. Tnx agn es 73's.

26. hello

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2002-09-09 15:43:30 UTC
From: sparks98.g4kki
Topic: 26 Message: 26

Hi All,
i am a new member, i am G4KKI and i live in Manchester in the North West of England.
I have a ts530s.which has developed a slight fault and i wondered ifanyone has come across this and got a cure
.It seems to keep going deaf,i click the key or send switch and signals comeback up to normal.
The bandswitches seem ok . Wondered if perhaps the tx/rx relay might be at fault ?

Not had time yet to read through the messages that have been posted to the group but will do so
later this evening.
A very good afternoon/evening/morning to who ever is in the group,where ever you may be

73's de

Bill Stevenson G4KKI. RSARS 1596 FISTS 7709

Hi all

i forgot to tell you all a bit about myself,sorry. I am aged 54
and have been licensed since 1981,before that i was a radio op in the
army,Royal Corps of Signals. I joined as a boy aged 15 in 1964.
I operate allmost all on cw. apart from the TS530S i also own a
rather ancient KW2000B and an even older AR88LF RXER.
Lots more i could write but i won't bore you with it just now

Regards alll

Bill G4KKI

Definitely a relay. If you have a good cleaner such
as Cailube, you can just spritz the contacts a bit,
and cycle it. If you can, also slide a very narrow
piece of manila folder paper between the contacts with
the juice on it, and try to get both the NC and the NO
contacts.

If you have to replace the relay, it's Kenwood part
number S51-4402-05.

If you cannot locate one of these locally, let me
know, email direct please.

Those AR88's are quite the receiver, aren't they?

There is another Yahoo group that you may be
interested in, it's tuberadios.

A bit inactive now but it usually picks up in the
winter, when people are more interested in talking
about their glow-in-the-dark radios!

Hi Bill,
thanks for that info, i have tried to clean the relay contacts but it has made very little difference.
I will see if i can get a replacement relay from it over here but not sure yet how available they are in the
uk. Most the dealers here don't want to know you if they are'nt going to do the job themselves and
if your rig is over a couple of years old it's obsolete !
The cleaner i have used is Servisol super 10, i suppose that they are nearly all the same .I might try
putting the tx/rx over on the other contacts and tape the aux ones up for now. Never used the aux socket.

Bill,
here is a photo of the relay sorry it's out of focus but it's the best i can do with my simple camera.
Hope it's good enough to identify from.

best regards

Bill Stevenson

Bill,
sorry forgot you can't send photo/attachments in emails to yahoo.i'll post the pics in the files section
on the group site for you to look at as i could'nt find you r own email address in the one from yahoo.
When you have had a look at them i'll delete them.

best regards

Bill Stevenson

Definitely a relay. If you have a good cleaner such
as Cailube, you can just spritz the contacts a bit,
and cycle it. If you can, also slide a very narrow
piece of manila folder paper between the contacts with
the juice on it, and try to get both the NC and the NO
contacts.

If you have to replace the relay, it's Kenwood part
number S51-4402-05.

If you cannot locate one of these locally, let me
know, email direct please.

73!

OK pull back and give me a wider shot, so I can place
it... I might get a better idea of where it is in the
TS-530. I might have one in the shop soon, so I can
compare and tell you what it is.

Hi Bill,
i have the ts530s back in it's case, so i will take it out
again over the weekend. To get a closer shot i will place it
(carefully !) on my scanner and scan it !

My camera is just one of those cheap digital ones that came out
over here and not really much good.
I can use the rig but it keeps going deaf,just a quick flick of
the key now and again puts it back to normal.
73's for now Bill

Hi Bill,
here are 2 shots from further back,still out of focus i'm afraid. The relay is located inside the pa compartment. Bottom bit was covered by a small shield. Access to conections from inside the pa compartment,and removal of the cooling fan. Is this better ?

Ok Bill,
yes that is the antenna relay,i thought that was the one which was at fault,with the rig appearing deaf
and then signals going back up to normal.
Where is the keying relay ? and could this also be the cause of the same symptoms ?
I will take the case off again tomorrow and read the part number on the relay case,been a bit busy today
fitting some furnishings in my Daughters bathroom.
My apologies to the group as i appear to have sent my last email twice for some reason.

best regards

Yes the keying relay can also be at fault. It
switches the receive and transmit 8v around, just
check to make sure that those respective voltages are
behaving. I think that relay in on the "audio unit",
mounted under neath the chassis just under the RF
unit, no?

tapping on the relay may isolate the source of the
problem.

I have never had to replace the antenna relay in any
of these rigs, just the keying relay...

Hi,
This is Steve, M3AOY, from the good old north east of England (Geordieland). I bought a TS820S in May but I'm frightened to use it 'cos I'm limited to 10W. I think its the DRIVE I've got to adjust but a) is it possible to run an '820 at 10W and b) is this the right control. I Have an external SWR & power meter. If not ,its great for listening..... I'm going for the full RAE anyway- so should I

Bill,
last night i cleaned this other relay and now the 530 is back to how it used to be. Thanks for helping sort this out.Will email again later when i get chance to sit down for more than just a minute.
best regards

Bill Stevenson
G4KKI. RSARS 1596 FISTS 7709

Yes the keying relay can also be at fault. It
switches the receive and transmit 8v around, just
check to make sure that those respective voltages are
behaving. I think that relay in on the "audio unit",
mounted under neath the chassis just under the RF
unit, no?

tapping on the relay may isolate the source of the
problem.

I have never had to replace the antenna relay in any
of these rigs, just the keying relay...

HI Steve,
If you are handy with electronic repair you can jury
rig the TS-820 to run low power.

There is a "SG" switch on the back which switches the
screens from a positive bias to a negative bias, to
shut the tubes down when you are using a transverter.

I have converted this switch to a QRP switch for guys
before. I will look up the changes and get back to
you in a day or two.
73!

Hi Lino.

I am not aware of a mod for this.

Do you need more range on the RIT/XIT?

If so, can you find a VFO-830

From: sparks98.g4kki
Topic: 50 Message: 50

Hi All,
i have scanned the TS530S instruction manual and converted it to a pdf file. It's just in black and white but i dare say i could re scan the pictures in grey scale. At the moment it's about 1.6 mb . If any one is interested in a copy just email me.

best regards

Bill Stevenson

Dear Bill,

First, let me thank you for accepting my sign up to learn more about these units.

From the posts I have read, it is clear you all know what you are doing.

Needless to say, I have one, a TS-820s that is having a problem.

I hope to learn how to fix it although I am not a technical person.

Again, thank you very much and I look forward to a new learning experience.

Victor Poag
Columbus, Ohio

Hi Victor.

You are most welcome! Glad to have you aboard.

I try to greet each new member, but have been a little
extra busy these days at the brewery (Coors).

Just post your question and let's see if we can't
figure out what you need to do. It's surprising what
hams can do with a little guidance to get started.

73!

Bill

53. 820 Question

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2002-09-19 00:26:44 UTC
From: vpoag
Topic: 53 Message: 53

Bill, Thank you for the greeting and salutation.

I am trying to get back on the air after being absent for the last 37 years raising kids and family. My call is W4ONB and I am located in Columbus, Ohio.

I ran across a TS 820S and it worked one day and then it "popped" while trying to turn it on. I checked the fuse, but that is all I know to do. I did receive on it before the "pop."

There is no power, no lights, no nothing.

Any ideas would be appreciated. If not, it is off to the repair shop.

Thanks for any suggestions.

Victor

54. Re: [TS-520_820_530_830] Digest Number 15

Steve,
you should be able to run the 820 at 10 watts, if on cw just adjust the carrier control to give 10 watts.
on ssb you need to adjust the mic gain, there may be another way by controlling the alc but not to sure how to go about it on the 820
maybe someone else in the group can tell you .

best regards

Hi,
This is Steve, M3AOY, from the good old north east of England
(Geordieland). I bought a TS820S in May but I'm frightened to use it 'cos
I'm limited to 10W. I think its the DRIVE I've got to adjust but a) is it
possible to run an '820 at 10W and b) is this the right control. I Have an
external SWR & power meter. If not ,its great for listening..... I'm
going for the full RAE anyway- so should I

Lino,

If memory serves my correctly, I think the RIT / XIT are controlled by separate 10K presets which vary the voltage to a varicap capacitor providing the frequency shift. VR5 tends to ring a bell for the RIT control. I will have to consult the drawings again.

Although I have never tried to alter this value it would be limited to the capacitance swing of the varicap.

I will consult the circuit diagrams and get back to you.

Greg Milligan

Victor,

If the line fuse is blown (don't fuse it over 5 or 6
amps, please!), take the covers off. Unplug rig, and
take cover off the pa compartment. Discharge the
plate voltage by shorting the plate suppressors
against ground. Remove the tubes, and make sure the
plate connectors are not touching anything.

Replace the line fuse and fire up the rig. If the
line fuse is OK, you have bad tubes... Get a
replacement pair then send me email and I will tell
you what to do next. If the line fuse blows with
tubes OUT, you have shorted hi-v caps. email me, i
will get you the kenwood part number for two new caps.

73!

Bill,

You are amazing. I will try and get this done in the next several days. I am able to understand what you are talking about.

I will follow up with you soon. If I need stuff, you are first in line.

Give me a few days (work is in my way right now) and I will let you know the outcome.

Thanks A MILLION.

Victor

Dear Bill,

First, forgive my delay in getting back to you and the group. Work is just toooo much anymore.

Here is where I am with the 820s. Per your instructions, i replaced the line fuse and removed the old tubes. The unit will now light up on the meter, but all else is dead. I am going to install some new tubes this afternoon and will seek your advice on what to do next.

I removed the big tubes. Isn't there one more in the unit and should it be replaced.

Thanks for all your help and assistance.

Victor

Dear Bill,

This afternoon, I replaced all three tubes. Here is what I have. Light on the meter, fan runs, tubes glow and nothing else. No receive, no digitial display, etc.

I did notice that the huge transformer in the middle of the unit seems cold. It never warmed up.

I am at a loss. As you suggesste, could it be the high v caps?

Any help will be greatly appreciated.

OK I forgot where we are at... anyway, put the tubes
back in, put the PA cage cover on, and see if it blows
the line fuse (filaments OFF). If not, then turn the
filaments ON. If it blows the line fuse after a few
seconds or so, you have bad tubes, if not, either the
tubes are OK or the cathode resistors are open.

let me know

OK Victor, now check that the aux VFO dummy plug is in
the back of the rig. This small plug is needed if you
do not have the VFO-820. All it does is jumper pins 8
and 9 of the 9-pin socket in the back of the rig.

If you don't have the plug, unplug the rig and solder
a jumper between pins 8 and 9 on that remote jack,
from inside the rig. See if that doesn't wake things
up.

Dear Bill,

The vfo plug is installed. That was one of the first things I thought of.

There is no movement on the meter with antenna plugged in.

There is no meter movement in tune or receive.

Could it be the high voltage caps?

No, bad HV caps blow fuses. You have a low voltage
problem, I suspect.

All bands are dead, I suspect.

Find the 12v DC supply in the rig and check that
first.

Hi all,

Just joined this group and wanted to say hi. I am not a ham, but, with any luck, will be by this time next week. I am taking the Tech, General, and code tests this weekend. Code study is going okay, book material is pretty straight-forward, should be okay.

In prowling through ebay, I am very attracted to any of these series of radios, although the 530 and 830 appeal to me the most. Don't know exactly why, just love knobs I guess. Looking for some advice on fair price. What would you suggest for either of these units? We have a swap meet coming up at the end of October, any hints for picking up a good radio at one of these?

Look forward to your answers,
- Wayne

Wayne, good luck on the test.

The 530 and 830 will both give you good service. The
830 has better IF system, and allows for dual filters
I believe. This is a plus if you are planning on a
lot of CW operation during contests and DX'ing.

530's are going for around $500 and 830's around 600,
for good cosmetic condition rigs, NON-SMOKER rigs.
Don't EVEN buy a smoker's rig. Too much maint to get
them up to snuff.

Watch for a rig that has bandswitch problems. These
are caused by a broken coupling on the bandswitch
shaft, going into the PA cage. They are easily fixed,
and will often result in 100-150 reduction in price.

Make sure you get the little aux VFO dummy plug that
goes in the back; otherwise the VFO won't work (again,
easily fixed).

73 and good luck!

Hi everyone,
I have a TS-820 and was wondering if anyone had experienced a couple of problems that I have been having!
I have three questions actually. First, I noticed that the drive setting on 20 and 40 meters is different between TX and RX. I suspect that this is a alignment issue just on these two bands. Second, I don't think the s meter is indicating right on receive. I have never seen a signal better than s-9. This may not be a problem but just my inexperience with this rig, it's just that I feel like it is wrong because of close station signal rst's. Third, the RIT function does not always center correctly. Some of the time with the RIT knob centered when activated I get about a 2.5kc change in freq. Other times there is little or no deviation from VFO freq. This is frustrating when scanning the bands as I never know when the RIT is going to be centered when I'm zeroing in on a potential contact.
I'm a new Ham so some of this could be me! Any assistance will be greatly appreciated.

73 de,
Mike, AB8PK

Hi Bill,
Tks for the prompt reply! I already have a manual and I am familiarizing myself with the alignment procedure. I have never done a radio alignment per se but I have worked with electronics most of my life. I believe I can handle it with your guidance. My only experience with radio alignment has been with a heathkit HW101 that I am currently restoring. I guess the most important thing is patients and following directions. I know with the HW101 most of the adjustments I have made have had an effect on other adjustments. It seems to me like using a ant tuner. You have to make an adjustment check it and maybe adjust something else. You guidence will be much appreciated. The HW101 is my project be at the moment. The TS820 is my workhorse. I would prefer that this rig was not down for very long! Tks again for the reply. I look forward to hearing from you again!

Tks Bill,
de Mike AB8PK

Topic: 66 Message: 69

OK here is your first step with the 820:

ALIGNEMENT OF COIL PACK (RF UNIT).

hook radio to dummy load (no, not the CB operator next door)

Using the CAL, peak the receiver on 10M, around 28.6, by adjusting the preselector or drive tune

Using a plastic tool that is shaped just right (you will have to carve one unless you are lucky and have the orange tool that Comspec ships with their CTCSS boards), carefully peak the 10M ant and driver grid coil (1st row, and 2nd row back).

Put radio in TUNE mode, filaments on, and tx just enough cariier to get some plate current. Dip if you want to, not really necessary. 100-125 ma. Using a LARGER plastic tool that you have also carved specially for the 820, peak the PA plate current with the driver plate coil (toward rear of rig, in front of the pa cage).

Do this on all bands and your peak on tx and rx will be the same.

While you are at it, removed the fan in the back and lube it. there are two small holes, one in each bearing cup, inject a couple drops of 10W oil (any pen oiler is good). If you see a lot of dirt in the PA cage, blow it out with compressed air.

Bill,
I want to thank you for your help! I just finished a complete alignment on my rig tonight and wow what a difference a little tweeking makes. I enjoyed using this rig before, now it is just that much more enjoyable! The only thing I am unsure of is the s-meter sensitivity adjustment. I have an old Heath Sig gen but it happens to be in storage at the moment. Even if I had it here I would have no idea how to adust it for precise 40 db signal to set meter to s-9. How do you set up the s-meter in your rig? As I mentioned in my first post, I didn't think the s-meter was sensitive enouph and I thought it read low. I went ahead and adjusted the sensitivity using the marker gen as a signal and now I think it is too sensitive. Maybe you have a sugestion. Any ideas would be appreciated.

Tks de,
Mike AB8PK

Set the "s" meter zero first. Put it on a ten meter
antenna, no signal, and crank the zero until the meter
just starts to move off "0".

Then, set your s9 level, so that it "looks about
right". Most 100w stations on 20M should be giving
you s7-s9 action. 10m would be around s2-s3 if the
band is open, and on 40 and 80m at night, nothing
should read under s9!!!

Just set it to be s9 on a "fairly strong signal" on
20M that pretty much doesn't allow much noise through,
and you will be about right.

That's right, with AGC off, meter should be zero as it
is your AGC voltmeter.

Remove top cover, locate front of RF unit pc board.

Look for a black jumper wire "J2", which comes from
the junction of D4, D5, and D6. Cut the wire, and
tape or heat-shrink both ends.

Should not need alignement, but if so, peak the marked
coils on the front and middle set for each band, on
receive, with the preselector placed in the middle of
each band segment, then in dummy load and tune mode,
turn carrier just high enough to get ALC indication
and then peak the proper coil toward the rear of the
RF unit near the PA enclosure. Note, these
adjustments will take two different tools, hand make
them if you need to with exacto knife and hard plastic
alignment tool.

Dear Bill and Members of the Group,

Well, it sure has been active lately on 820s and 530s. Great.

Let me update on the problem with the 820s.

Problem.

No rx, Tx, no meter movement, no digital, no noise, no sound.
I do have a meter light and that is it.

Fuse--OK
HV Caps--OK
Changed Tubes--OK

Checked low voltage supply--OK

It has been suggested that the relay that takes the signal is bad. Also, across the internet, there was an indication the above stated problem could be the Zener Diode on the same board as the relay.

Any suggestions from Bill or the group will be appreciated so I may move the restore project ahead.

Thank again.

Victor Poag

Just found one of those broken bandswitches on an 830 which I recently bought. I guess it was ready to go!

Hope you are right about the ease of the fix. Looks like part of the flex coupling has broken so what is your easy fix? Are parts available or is it a matter of finding a substitute?

Thanks for any information.

Jim

D4 D5 D6 are all connected by their cathodes to the land that also has the black wire on it. Imagine the diodes all pointed to the wire. You can also cut each diode to enable each warc band but that is somewhat more difficult.

Definitely be looking for a service manual on ebay.

Check the VCO test point on each band.

Do you have service manual?

These couplings should be available from Kenwood,

D22-0402-05

loosen coupling, pull band switch shaft out a little
from the front panel, work the old coupling out, put
new one in. make sure you use metric hex wrench, I
think it's 1.5mm?

Dear Bill,

Yes, I do have a service manual for the 820s. the manual says to check the voltage at the test point on tp4, i believe.

Would this be correct.

Thanks.

I think so, if that is on the VCO unit (bottom of
rig).

Set the VFO per the manual on each band and check for
the proper voltage. That will tell us if the VFO and
the VCO/PLL stuff is working.

Dear Bill,

Well, I tried checking the voltage on the vco unit and I keep getting a negative .018 instead of 3.2 v. It is the same on any band I switch in.

I am slowly getting in over my head. Does the negative voltage indicate a power supply problem or a signal problem?

Lost inside a ts 820.

Vic

It just indicates that your VCO is dead, could be the
regulated power supply, I think it's 8 volts? Locate
the regulator circuit, I think it's on the AF unit.

Hi all,

What is the significance of some 830s having a "gold label"? I see this in occasional ads on ebay. Makes it sound like some kind of a special model, but what makes it special? (besides having a gold label, that is ;).

Thanks!
- Wayne

Dear Bill & Members of the Group,

Bill, here is an update for you on my ts-820s that was dead, dead and more dead. I did check the af unit as you suggested and I did find a problem.

The voltage trouble you suggested was correct. After replacing the bridge rectifiers diodes in the main power supply, voltage did return to the unit.

However, it was not until I found a bad molex connector on the af unit that the radio came to life. It receives perfectly now.

However. It is receiving, but I get no bias reading in the IP meter position on transmit. YOu have taken me this far, would I be so lucky as to get another idea on which way to go.

Thank you for your help and maybe this will help others.

Topic: 97 Message: 98

Check the position of the SG switch in the back of the rig. It must be ON. Note, you can turn this OFF to prevent unauthorized transmitting (ever have grandkids in the shack?).

If that is not the problem:

Check the grid voltage reading on the 6146s (dc, no drive applied--use SSB mode to tx) in tx mode, and in receive mode and post us on the readings.

Should be about minus 115 volts (this will bias the tubes OFF for receive). Then check it in tx mode. With the "bias" pot, you should be able to vary the grid voltage from minus 115 to about minus 45 volts, at which point you should have a BOATLOAD of plate current. Don't let that condtion happen for more than a few seconds.

If you have plenty of plate current, your tubes and bias and screen supplies are ok.

If you don't have any tube current, with the bias at minimum (i.e. closest to zero volts, about -45v), you either have bad tubes, or your screen supply has failed. Check your screen voltage on the tubes... should be 220-270 vdc positive in tx mode.

If not, check the 100 ohm resistors for the screens on the tubes... they may be open.

Then check the 2w, 470 ohm screen dropping resistor on the voltage rectifier unit. Do this by checking for the 220v and the 300 volt DC on the pins on the board.

Let me know what you find. Most likely, the 470 ohm resistor is blown; this will happen if you get a grid/grid short in one of the tubes. When you replace it, do NOT go higher in wattage and DO mount it high above the board. It acts like a very effective FUSE and when it burns, you don't want it to damage the PC board.

Have fun. You are well into my $100 labor range so far! hi hi

Topic: 99 Message: 99

Hi, I am Bill, K2WH. My very first rig 33 years ago was a Kenwood TS-820s. I didn't have a long time to discover the way the TS-820s performed because I had to sell it 6 months after receiving it. I recently went on a binge and with some nostalgia biting me, I bought 2 TS-820s, 1 TS-520, 1 SM-220, 1 Matching speaker for the TS-820s, 1 Matching speaker for the TS-520, 2 external 520 VFO's and 1 external 820 VFO.

So, I have 2 complete Kenwood stations. I am very happy with the way they work and enjoy using them more than my ICOM-756pro!

I have a question. Does anyone know where to get parts for these wonderful radios? The digital display on my 820 wants to have the number '9' in the second place no matter what I do. All the other numbers are correct for the frequency in use. Not a big problem but a little annoying. Anyone with any ideas on this one? I cleaned all the card connectors a couple of times. Any info greatly appreciated. BTW, I opened a new folder in the photo's section. It contains a couple of pictures of some of my Kenwood collection. Enjoy.

Hi Bill. I am Art, K0OQ, and I am new to this site as well. My first rig (in '75) was a TS520 (still have it) and it works great. AS far as your problem with the 820 goes, I don't have any schematics available, but I would guess (because of the age of the rig) the problem may very well be with a driver chip (or a latch) for the display. If the display is working (is it a seven segment LED?) it is probably fine - but either the seven segment display driver (if it is a TTL chip, it would be something like a 7447 - I think - I don't know what it would be at all if it were CMOS.) There is also a latch that will probably driving the display driver, and that may be what is bad. I am assuming that the rig is using discreet TTL chips - most of the rigs today use 'monolithic' ICs and are heavily integrated. The way to troubleshoot this would probably be with a logic probe - if you don't have one, you would be looking for either 0 or 5 volts with a voltmeter, and use the spec sheets for the chips if you don't have a schematic. Good luck! Let me know if this helps.

By the way, if anyone is interested, there is a really great Russian web site with lots of manuals (many of the schematics are in the DjVu format, instructions for downloading the plug in are on the web page). It has lots of manuals, schematics and even control software. Nothing, though for the 820.
http://hamradio.online.ru/sch_eng.html

Best wishes and 73's.

Art

102. First station coming together - antenna help?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2002-10-30 01:35:48 UTC
From: waynem3612
Topic: 102 Message: 102

Hi all,

I think in my first post here I was still prepping for my exam. Well, I passed the first 3 elements, so now I am a general. I located a decent TS-830 on swap.qth.com, and that is now sitting on my desk. All I need is an antenna, and I'm good to go!

Therein lies my question. I'm not quite sure about antennas and tuners. I don't understand how much a tuner can modify the natural resonance of an antenna. For instance, one of my options is to install a dipole in my attic. I have a straight shot of about 50 feet, so I could build a dipole for about 30 meters (or less). But if I add a tuner how much can I change that? In which direction? I could also put up a 60-70 foot dipole outside, but it wouldn't be as high and that's not as attractive to my wife ;). So any advice for a newcomer?

Thanks in advance. 73,
Wayne KD7SWM

Start low key. 20M dipole, 16' each side, feed with
RG8X, show wife how much fun ham radio is. Next
spring, go for another 40M dipole outside. Forget the
tuner if you can. Your rig can handle up to 3;1 swr
no problem. I will tell you how to tune into high SWR
with tube rig. I do it all the time.

20M is best bang for buck, if you can have only one
antenna.

Topic: 102 Message: 105

HIi Wayne,

Well, where to start... First, a tuner does nothing to the resonant frequency of an antenna... Only physical things like length and width of the conductors do that... If you have a dipole cut to length, or a nice trap dipole, the antenna can be connected to the rig directly with coax... 50 ohm usually... If the SWR is less than 2:1, don't worry about it... just have fun.. You might want to consult any of the numerous sources on antennas... printed and web based... The tuner, or matchbox is useful if you feed the dipole with twin lead at 300 ohms or so.. That makes it multiband without the traps... see G5RV references... Or, you can run insulated wire vertically then along your attic eave and have a long wire or flat top array depending on the operating frequency.. One key element to make sure of is a good GROUND... by that I mean a good RF ground as well as a good Electrical ground... Lay out some chicken wire... drive a few spaced 8' rods... anything you can do to get the ground better is going to help... and it will help with any interference problems you have... There are also lots of forums on hidden antennas... try those...

I am an 830 user, but not for seven years... been out of the country and not able to operate... coming back to the US in two days... will have the rig on just after new years... Hope all the caps are not dried out... we shall see... I may be a frequent quester here.... Loved my 830... operate 40-20 CW mostly... chase DX... I worked 138 countries in about a year from a Ft. Worth QTH which had antenna covenants... Hid a bobtail curtain in some Photina bushes... could not see it from 20 feet away... gave me about 5 dB gain and vertical polarization... love it... will be my first antenna up when I get back... The other antenna was an inverted vee for 30 which doubled as TV antenna guy wires... hehe.

Good luck and may see you on the air sometime..

Welcome home, Wayne!

Good antenna advice.

I might turn loose of my "single element quad loop
wire antenna in the trees" secret, if someone will buy
me a cup of coffee!

Hi Guys,
been reading the mail with interest, welcome to the new members from here
in Manchester,UK.
My 530 is now behaving it's self thanks bill for your help whenn i needed it.
all this talk about antennas has me going green. Here am in a city lot and my back yard is
15 foot by 20 foot ! no front garden at all. Still with a half size g5rv in an inverted vee
shape
plus a pair of home brewed magnetic loops i get out a signal.Some how it gets out world
wide.
Keep your emails to the group going am building up a nice file of faults and cures.

regards to all

Bill G4KKI.

Bill, thanks for your kind words! I get a lot out of
seeing guys fix their own rigs up.

Be happy with the antennas you have, so many are
confined to mobile operation, or no HF at all.

73!

Bill

You are such a great group of guys (maybe some ladies too?)! I appreciate all the help and advice. And Bill, if and when I need help repairing my rig, it's a great comfort knowing you are here.

Now let me repeat what I think I heard from Raleigh and Bill about antennas. Option 1 is a dipole cut to length of the band I want, fed with coax, straight into the transceiver, no tuner required. Option 2 is a dipole fed with twinlead, going to a tuner, and with that I can tune to more than one band? How does the dipole length factor in to the second option?

Thanks again everyone! I am anxious to get on the air. I would like to run down to HRO this weekend and buy enough parts to get me going.

Bill (G4KKI)

I would be interested in how you have set up the configuration of your half size G5RV and your home brew mag loops I also have a similar problem with garden size. I am located in Coventry (almost directly in the center of England to those you do not know it), so perhaps we could hook up over the air at some point?

I have started to notice that when listening to morse on my TS-530 the quality of the tone tends be masked by mains (50Hz) hum, I dont think that all of them are noisy transmitters, I am wondering if their may be a fault in the audio stage.

Have you ever noticed this on yours?

Perhaps I should open this to the group, could this be a leaky or dried up capacitor in the audio stage?

Dipole length with the second option is not a factor at
all as long as the antenna is at least the correct resonant
length for the lowest band you wish to operate on. I use
a 250' dipole up about 50' on 160 to 10 meters with a tuner.
Works wonderfully.

Wayne,
The single dipole/single band is the easiest to get going, of course, and is the usual "first antenna" for most.

The open-wire feed dipole must be cut for the lowest band you are going to operate (as a rule, it's much easier to tune an antenna for it's intended band OR HIGHER, but not LOWER). A 20M, open-wire fed dipole will work 20-10M, and POSSIBLY 30M. An 80M dipole 132 feet long will work 80 and up.

There are always exceptions to any "rule"; with the open wire feed dipole, there are some combinations of band and feedline length that just won't work; these are found only by trial and error, although I think the ARRL antenna book will tell you some obvious mis-match combinations that should be avoided.

The other issue with a "tuned feeder" approach (that is, open wire line, antenna fed basically off-resonance) is the tuner. An MFJ "300 watt" tuner will JUST be adequate for your rig on MOST bands. On some combinations however, it will arc, even at very low power levels. You just have to try and see.

A complicating factor with your rig and a tuner is, which do you tune first? It will slow down QSY to other bands somewhat, but at least you will be able to do it. If you get a tuner, make sure you get one with a 100W rated dummy load. Tune the rig into the dummy load for max output, then reduce power with the carrier control, then tune the tuner for minimum SWR (recommend cross-needle meters, they make it easy).

Then, increase your power, or switch to SSB, switch the tuner over to your antenna, and operate. Don't go back and forth tuning this and that, you will just confuse yourself and put unnecessary wear and tear on your final tubes.

If using a tuner and tuned feeders, you will acquire the skill of tuning the tuner for maximum received noise first. This will get you in the ball park on the tuner settings. You will also learn to mark your

settings in the log for each band (or segment), to
allow quicker band change. After a while, you will be
relatively quick at doing this. Especially during
contests and DX chasing!

Have fun. And Raleigh and the rest of the list,
please jump in and pick this apart or add to it as you
see fit. That way, Wayne will get a "better picture"!
hi hi

73!

Also want to recommend the Cushcraft R7000, it is a
great antenna from what I have heard of it on the air.
Also the Gap Titan and Challenger are always loud
here. Keep in mind, verticals work great out past
1,000 miles... closer in, you want a good NVIS antenna
like a dipole.

bill the other.

Dear Wayne,

Nothing quite so exciting as the first QSO... good luck...
If you have an HRO, you might want to measure your attic space first... determine what length you have available, and see if HRO has a trap dipole that will fit in your space available... That is the quick and dirty way to multiband operation... The reply from bill on antenna tuners and tuning...was right smack dab on the money.. very succinct and accurate... If you want to operate on the lower bands, consider the random length long wire... just connect the single wire to the tuner post... and the other to a GOOD ground... You should be able to get down to 40 meters pretty easily... but I agree that 20 is probably the most "productive" band...

I have to go QRT for a few days folks... I have a 25 hour airplane ride which begins in about five hours from now... may make it back online next week sometime... be interesting to see how you made out Wayne...

waynem3612 <waynelynn.moore@...> wrote: You are such a great group of guys (maybe some ladies too?)! I
appreciate all the help and advice. And Bill, if and when I need help repairing my rig, it's a great comfort knowing you are here.

Now let me repeat what I think I heard from Raleigh and Bill about antennas. Option 1 is a dipole cut to length of the band I want, fed with coax, straight into the transceiver, no tuner required. Option 2 is a dipole fed with twinlead, going to a tuner, and with that I can tune to more than one band? How does the dipole length factor in to the second option?

Thanks again everyone! I am anxious to get on the air. I would like to run down to HRO this weekend and buy enough parts to get me going.

rig directly with coax... 50 ohm usually... If the SWR is less than 2:1, don't worry about it... just have fun.. You might want to consult any of the numerous sources on antennas... printed and web based... The tuner, or matchbox is useful if you feed the dipole with twin lead at 300 ohms or so.. That makes it multiband without the traps... see G5RV references... Or, you can run insulated wire vertically then along your attic eave and have a long wire or flat top array depending on the operating frequency.. One key element to make sure of is a good GROUND... by that I mean a good RF ground as well as a good Electrical ground... Lay out some chicken wire... drive a few spaced 8' rods... anything you can do to get the ground better is going to help... and it will help with any interference problems you have... There are also lots of forums on hidden antennas... try those...

> I am an 830 user, but not for seven years... been out of the country and not able to operate... coming back to the US in two days... will have the rig on just after new years... Topic: 102 Message: 118

The other downside to tuned feeders (and longwires)
is, they can introduce RFI to your shack and other
electronics in the house, including computers, the
daughter's CD player (DDDDAAAAAAAAAD, you're doing it
a-GAAAIINNNNN), and the disgusting telephone...

But, even with a single band, untuned feeder, resonant
dipole with 1:1 swr, in the attic you are going to
have much the same problem. You may have to run QRP,
but that's ok too! hi

bill

PS thanks for confirming my last post!

119. RE: [TS-520_820_530_830] Re: First station coming together - antenna help?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2002-11-01 14:16:32 UTC
From: Bill Gerhold
Topic: 102 Message: 119
Attachments: 1 described; binary payloads are missing from this source WARC

The use of ladder line or open wire line in the
shack will not introduce RF in the shack if properly
utilized or installed.

Ladder line or open wire lines are self shielding
because currents in the parallel feeders are 180 degrees
out of phase. Hence, cancellation of the signal takes
place and no radiation from the feeder. The law of
reciprocity also suggests that the line will not receive
any signals either or add a vertical component to the
signals (as some misguided amateurs suggest) in transmit
or receive. Very nearly full cancellation of incoming or
outgoing signals takes place. The bulk of "RF in the shack",
will come from proximity to the antenna and RF field it
presents.

However, cancellation will be true only for a fully balanced
antenna system and to a certain extent on the
interplay of the frequency used and distance (spacing)
of the parallel feeders.

Balanced means you are feeding the antenna at the
exact center of the dipole - hence, it is a balanced
antenna fed with balanced line. That is where we get
the term "Balanced Feeders" from.

RF in the shack is usually caused by the proximity of the
antenna to the electronics in the house. Electronics in
a strong RF field will act very strangely and can cause
damage to certain systems. Other reasons for RF in the
shack is an unbalanced antenna (not fed at the center)
causing a balanced feeder to radiate or feeding a long
wire antenna without a counterpoise. Again, no balance
in the system.

I run 1.5kw in my shack into ladder line and a dipole
(no coax or baluns) without any RF in the shack whatsoever
even though the ladder line is only 1-2 feet from all
other electronics. The antenna is about 50ft above the house.

Bottom line, RF in the shack is caused by a number of reasons
but not because one has decided to use open wire or ladder line.
It is the misapplication or incorrect installation of the feeder
line that causes the problems.

Gavin,
great to hear from you and sorry to hear you have the same problem as me but it is one which
you can get round ! Iknow you are restricted to 10 watts with the m3 ticket but i ran qrp 2 or 3 watts for over 10
years and managed to work all over the globe,cw .
My magnetic loops are in the loft and the half size g5rv is an inverted v going from the gutter just outside my
upstairs shack to two insulators on top of the back yard wall about 6 feet off the ground.
If you want to send me your email address i will scan the details of the homemade magnetic loops and also the
info i have on the g5rv etc.
I don't have the problem you mention with the 50hz hum but i have heard someone else mention it but they
were'nt using a 530.

Cheers
another Bill !!!

Bill (G4KKI)

I would be interested in how you have set up the configuration of your
half size G5RV and your home brew mag loops I also have a similar
problem with garden size. I am located in Coventry (almost directly in
the center of England to those you do not know it), so perhaps we could
hook up over the air at some point?

I have started to notice that when listening to morse on my TS-530 the
quality of the tone tends be masked by mains (50Hz) hum, I dont think
that all of them are noisy transmitters, I am wondering if their may be
a fault in the audio stage.

Have you ever noticed this on yours?

Perhaps I should open this to the group, could this be a leaky or dried
up capacitor in the audio stage?

Bill,
Did you happen to remove me from the TS-520-820-530-830 list by mistake?
Since our last e-mail exchange, there hasn't been a posting and I miss
reading about my TS-820S's. Just checked and the last msg was dated 10/29

Hope all is well and that the pearly wisdom starts once again.

Nope. you are on the list, set for individual emails,
and you aren't bouncing... not sure what the problem
is.

Check the archives to get caught up, there were a
bunch of posts around 10/31 and 11/1 regarding a first
antenna...

Thanks Mike. The 830 was a fine rig when it came out, and is still an "upper end" radio in my opinion. It's as quiet as the new high-end radios and the dual filters sure help.

TO the Ham Group

Have not seen much on this group setting. I just bought my 530 on the internet about a month ago, from some fellow in Michigan. I am very pleased with the radio. I only have a Tech license so only use it for listening.
I was a novice about 35 years ago so a radio of this calibar is realy fun to work with. I can find the code stations very easily and then they stay in tune. On the old hallicrafters we used to copy code with one hand and tune with the other. Was still a lot of fun.

Merry Christmas to all

Gary KCØNPJ

I am very pleased with the radio. I only have a Tech license so only use it for listening. I was a novice about 35 years ago so a radio of this calibar is realy fun to work with. I can find the code stations very easily and then they stay in tune. On the old hallicrafters we used to copy code with one hand and tune with the other. Was still a lot of fun. Merry Christmas to all Gary KC?NPJ

Hi, I just found this group and I decided to look around. I have been a ham since 1992, although I first had a novice call in the early 60's when I was a kid. I first got a Yaesu FT747 which I have used for years for digital modes. I then picked up a Heathkit GR54, Hammarlund HQ-170, Hallicrafters SX-110 and SX101A, and now a Kenwood TS-520SE. I guess I like old radios much to the complaining of my wife.
I just got the 520 last week and I am sure I will have some questions as I get stuff ready to go on the air with it. Main thing I have to do is get a mike ready for it. I do have a mike with a Heil HC-5 element that I need to get a matching transformer before I use it.

Hi Bob.
I just sent you invite to another group,
http://groups.yahoo.com/group/tuberadio/
As for your wife, just tell her that all this old stuff you have is appreciating between 200 and 1000 percent faster than the rate of inflation, or the best rate you could get on a 5 year CD. That might help. I have been blessed with a great wife, Bonnie (KB0HTC) who loves the vintage stuff... she wired a new power cord to 1938 Coronado floor model and flipped the switch herself for the "smoke test"... worked right off the bat, and now she loves it! Try to get her involved with her own table model vintage receiver, see what happens.

Hello all,

I'm Jose Pedro, CA3RVF, in hot Santiago, Chile.
I have been a ham for about 10 years, although I wasnt active in the last 5 years due to antenna restrictions in my former apartment.
Now I moved to a little house where I can put up at least a couple of dipoles. And to celebrate it I got myself a nice HF station composed by a TS-820S, VFO-820, SP-830, AT-230 and the MC-50 mic. My ticket is restricted to 80, 40 and 10 meter bands, at least while I study to upgrade.

Nice setup. I myself have the very same setup
except, I added the SM-220 station monitor to the
station. If you can find one of these, it makes
an excellent addition to the 820s lineup.

Jose, bienvenidos a mi grupa!
Congrats on the new place, always best to have your own house to hang antennas around. That is great. Hope to hear you on 40 or 10m some time. I would hope in the future that all countries would allow the lower-class licensees access to 15M, that would be a sure way to help that band grow more popular. In the U.S., 15M has a novice CW band and that is where many hams get their first taste of DX.
I am going to put up a 15m antenna, probably within a week. Ten will be going out in a year or two and 15 should be quite useful for a few more years.
Also would like to operate AM on 15M as there is plenty of room for it.
73 JP and thanks again for joining.

143. International Radio (INRAD) Performance enhancement Kits and other stuff

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2002-12-19 18:07:57 UTC
From: José Pedro Alvarez C.
Topic: 143 Message: 143

Hello All,

Thanks for the welcome to the group.

First of all I would like to apologize if my english is hard to understand. English is a second language for me and I dont have the opportunity to practice it as much as I would like to.

As soon as I got the TS-820 I ordered the 3 kits advertised in the INRAD home page. It turned out they only had the QRO kit and the Mixer kit. The RF kit was discontinued. Anyone here can comment on these kits? I will have the mixer kit installed one of there days (I'm not proficient enough in electronics to install it myself). The instructions on the QRO kit make a reference to 6293 tubes, with I understand are similar in performance to 6146B's but much more stronger, so I will install that kit with those tubes when the tubes the in rig start showing a decrease in performance.

This Saturday I will be installing my mast (12 meter telescopic guyed) and some antennas.
I haven't had time to build antennas yet so for HF I will be raising a commercial wideband folded dipole made by Yaesu, model YA-30, that a friend lent to me. Actually this antenna was from my former station that I sold to him when I moved to an apartment. Now he is moving and has the station in storage and I have the opportunity to use the antenna again.

There is very little reference for this kind of antennas in the Internet. They are expensive and directed to the commercial market. I got this one brand new very cheap (and I sold it very cheap also).

From an amateur point of view, it's a great antenna for field day or temporary locations. The only real benefit is to have all bands in one antenna that gives low enough SWR to use an internal auto tuner. It is a mediocre performer in all bands.

As soon as I get time to go buy some wire and heat the soldering iron I will make a G5RV that will have a far better performance for 10% of the cost.

So far I have only been able to use the TS-820 once. A few weekends ago when I went to my father's house in the beach, where he has trees and enough space. I raised a 40 meter dipole and had a blast. I got great reports on the audio and signal. The meter in the AT-230 was peaking around 110 watts while SSB transmission, full mic gain, no compressor, so I guess the tubes are still good.

Dear Bill and the Group,

First, welcome to the new members. You have come to the right place. I wanted to update you on the 820s that finally is working after spending 3 months trying to fix it. Bill, you were correct about the 470 ohm resister on the power board. It was in fact bad and the bias returned after it was replaced. The biggest problem was the lack of transmit and that was fixed by replacing the relay on the af-avr unit. It took FOREVER to find the problem. Since it started working, there is one problem remaining. The digital frequency reads off by exactly 2 khz. If you or anyone in the group has an idea about how to correct this, it would be appreciated. Bill, thank you for your help and guidance on this. It has taken a long time, but it is a joy to work with the Kenwood. Again, thanks for your help.

Jose that is great, and your English is better than mine...
I hope to get some more ham time in the next few weeks... things are slowing down a bit on the work schedule.
Be careful with the mods you are speaking of. I don't know of any needs for a modificaiton to the mixer or RF stages,and while I have done the QRO mods on a couple of Kenwoods, I only saw an increase from 110 watts to 150 watts, and later one of them came back with the tubes fried and power supply damage, the owner wanted it put back in stock condition. He had used it a bit too long on TUNE mode I think!
Beware of "guilding the lily"... this is a phrase that means, the lily flower is pretty enough, why paint it with man-made gold paint? hi hi
Hope to see you on the air soon! Thanks for the post.

Hello!

I just joined this group and would like to introduce myself:

I recently upgraded to a full HF license, my callsign is DJ9PZ and my name is Arnd. I'm located in the south western part of Germany, some 55km / 34mi south west of Frankfurt/Main (you may try http://map.findu.com/dj9pz).

My HF station consists of a TS-820 and an AT-200 connected to monoband dipole for 20m (which works also quite well on 10m). Due to decreased output of my TS-820, a closer inspection revealed that both cathode resistors (10R 1W) had increased and varying resistance because they were broken.

Furthermore, one of the capacitors connecting the cathode to ground was only soldered on one end. After replacement of the resistors, output power is up again, nevertheless I will have to check for bad solder joints and as one of the screen grid resistors is out of specification (110R instead of 100R +-5%), I will replace both of these resistors as well.

Finally I would like to wish all of you a Merry Christmas and a Happy New Year!

Vy 73 de Arnd DJ9PZ (and KC2EZE as well)

Hello Arnd, and Merry Christmas!
Fine on your 820. The screen resistors are not that critical, but if they show signs of distress or burns, by all means replace them. Both the screen resistors and the cathode resistors also act as fuses, preventing damage to the rest of the radio in case of cathode current overload or tube failure; so don't use higher wattage on these than what was in there.
I am concerned about your 20M dipole, also working at 10M, are you sure of this? Does it have traps for 10M or are you using the tuner for 10M? The reason I ask is that on 10M, the 20M dipole represents a very high impedance, and this could translate to great difficulty for the tuner and/or the radio. If you have not had problems with these so far, it's probably ok...

Topic: 155 Message: 155

My name is Jim Kauppila AE4HL. We live in the northern part of Florida outside of a little town called Bronson. I've been a ham since 1995 but at our previous QTH (Tampa) deed restrictions limited my activity. My wife gave me a wonderful and expensive birthday present in 2000, an ICOM IC-746. Unfortunately, a direct lightning hit to my wire antenna destroyed that radio. I then bought a little dual band Patcomm 15 watt HF rig. This is what I'm using now but I've been wanting a more substantial rig. After reading the glowing reviews on eham.net and finding a clean rig on ebay, I decided to take a chance and purchase a 20 year old TS-520SE. I'm anxiously awaiting it's arrival. You can see the rig here: http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=1945676084 I've also purchased a JPS NIR-12 outboard DSP unit to use with the radio. I recently purchased a Heil HMM-Y dual cartridge hand mic to use with the Patcomm and Heil said to return it and they will exchange it for a 4pin Kenwood model and add a transformer if needed to match the high Z input of the TS-520SE. I can't wait to get the radio and am glad I found this group.

Merry Christmas and Happy Holidays to all

Jim

Hey Jim,
Welcome and Merry Christmas... Florida, and Tampa especially is the lightning capital of the U.S. And while nothing will stop a direct hit, there are some things that will help... a really GOOD DC Ground...with braid straps to ground rods... and you might consider wiring an antenna relay in such a manner that when you leave the shack and turn off the "big switch" it grounds the antennas, and the input to the rig through separate paths... just a though..

Had a TS-520 for a couple of years.. it was a loaner.. liked it so much that I returned it to its owner and bought an 830... worked lots of contacts and D\x (my passion) with the 520... you will have a great time with it... Old doesn't mean no good.

Hello Bill,

thank you very much for the warm welcome!

I know that using the dipole for 20m on 10m usually represents a high resistance but using the antenna tuner it is tuned easily to 1:1.5. The reasons may be that the dipole is mounted in the attic underneath the roof (due to overhead electric power lines 400V). On 20m I had to cut it considerably shorter than normally required (it is approx. 9.6m / 31 1/2' long) to get a decent SWR, the reasons may be the electric power lines (approx. 4m / 13' above the dipole in parallel) and a 19 element yagi for 430MHz (approx 2m / 6 1/2' above the dipole in parallel). A NEC simulation would have asked for a 10.2m / 33 1/2' long dipole).

Due to this environmental situation, a simulation using NEC will be quite difficult...

The dipole is made from RG-58 (using the braid), at the feed point there is a coaxial balun (collins balun) (3.5 + 3.5 turns of RG-58, diameter of 10cm / 4").

I had no problems working the US (1,3,8) Russia and Mauritius with very good reports. The output power is approx. 90W and the SWR around 1:1.5.

> I am concerned about your 20M dipole, also working at 10M, are you sure of this? Does it have traps for 10M or are you using the tuner for 10M? The reason I ask is that on 10M, the 20M dipole represents a very high impedance, and this could translate to great difficulty for the tuner and/or the radio. If you have not had problems with these so far, it's probably ok...

Jim, congrats on the "new" rig!!! Looks like a winner.
If you don't mind, I would like to use the eBay picture of your new rig for the club picture.
Just heard a TS-830 on AM, didn't know you could run AM on the 830!
73 and enjoy the group!

Hi Arnd,
Sounds like you have a good handle on the situation. Congrats on the DX that is great!
I am running wire loops here, 10 and 20m, they work great but they aren't high enough to do real well on DX. Sure can cover coast to coast in the US though, and that is important to me.

Gentleman

I have a TS530s that I just bought. I like the way the radio works. Its stable, tunnes easily,with good audio. Now my question is, What do the new radios, like the 570 do that these older radios can't do?
Thanks

General coverage, FM (only usable on top end of 10M but boy is it fun!), much easier to take portable for Field Day...

165. Neutralize TS-830S finals? (New member to list)

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2002-12-29 04:48:26 UTC
From: RamAirRocket <ramairrocket@yahoo.com>
Topic: 165 Message: 165

I am new to the list, and I was wondering if someone can help. I can't find my Service Manual and I need to neutralize the finals in my TS-830S.

When I got the rig I was told it had new 6146B's in it (confirmed, they are B's and they 'look' new).

But very low power out. Best I have seen is 9W.

I was told that the tubes hadn't been neutralized. Can someone scan or email the proceedure to neutralize the finals?

Or offer any other advice on what might be the problem?
Confirmed HV is present on the plate itself with a DMM, which did correlate with the front panel readings.

Hi,

Sounds to me like you have not enough drive... also you might want to check the screen and grid voltages first.. Neutralization would be a last step, and not likely the culprit with low output...

regards

Those pesky 100 ohm screen resistor "fuses" do like to open up, and sometimes only on one tube. Careful, if one is burned, don't upsize it... you will loose the fuse effect.
Also check the screen supply from the HI voltage unit, sometimes that 470 ohm resistor-fuse likes to open also. Same deal on the wattage, don't "upsize" it...
NY0Y is right, fix the power thing first then nuetralize.

Hello!

In addition, please check the two 10 Ohm / 1W cathode resistors (as they are parallel, the resistance between the final tubes cathodes and ground should be 5 Ohm). If they are somehow broken (and their resistance is higher), the meter shows a too high plate current... When tuning the finals for maximum allowed plate current you will end up with reduced output power...

Hi Gary!

This line of radio's are GREAT! I have owned a TS-820S, A TS-530S and now have a TS-520S. I have also had a TS-570DG, so can do a direct comparison.

These older radios are really built to last. They include a power supply and an inherent 'tuner' of sorts; Not to mention a SOLID metal case. Alot of newer rigs do not include a built in power supply or tuner and most are made of plastic.

The 520 line does not have an inherent digital frequency counter, but the analog dial works fine.

BTW, I found a place online selling counters JUST for these rigs, altho the price tag is a bit steep ($150ish). Some good working 520's themselves sell for this amount.

The older kenwood rigs do not do AM without modification (and then only receive SSB). They also do not have FM or wide band receivers as Bill mentioned.

Mainly, the newer rigs have alot of bells and whistles, but the irony is that the older Kenwood rigs sound as good or better on TX audio and receive as well as any other new fangled fancy do-dad rig.

With no DSP I simply use my RF GAIN to filter out the sound floor noise and get very clear and clean and LOUD audio.

These rigs tune my 80 meter dipole on 80-20-10 meters and my 40 meter dipole on 40 and 15 meters.

BTW, these rigs seem to not be too picky about the mic(s) you use. Hi or lo impedence mics all seem to sound fine.

And finally, the bottom line. For very few $ you can be in the HF world talking locally and around the world and just having a good ol time.

What a wonderful review Ed - KF6YKM has given on the older Kenwoods! After owning and operating one of these radios one begins to wonder just how necessary all of the "advanced" features are in the new rigs. And durability? There's no comparison! If you're really interested in a counter for your radio, try Allmost All Digital Electronics in Auburn, WA. http://www.aade.com/#dfd 73 Bob - N0CDY --- On Mon 12/30, snorkyp < snorkyp@... > wrote:From: snorkyp [mailto: snorkyp@...]To: TS-520_820_530_830@yahoogroups.comDate: Mon, 30 Dec 2002 07:21:10 -0000Subject: [TS-520_820_530_830] Re: Soon to be owner of TS-520SEHi Gary!This line of radio's are GREAT! Hello to all on the group.
My name is Charlie and I am some what new
to this group.
I am the proud owner of a TS-520SE with the
matching VFO-520S vfo and the SP-520 speaker.
I am presently looking for the matching AT-200
antenna tuner.
What can I say about this radio other than I
am having a blast. It is not my only radio, but it
is the most used.
Every one have a safe holiday and i will be looking
forward to future post from everyone
Take Care,
Charlie

Hi Bob, thanks for the link. I have boatanchor rigs and would love digital display for some functions.
As for durability, one is going to be hard pressed to exceed the standard set by (gasp) the Yaesu FT-1000 series! As popular as they are, I have only had three in the shop, and the highest repair bill was under $200.00, that for a lightning damage repair!
Hate to burst your bubble. But, the vintage rigs are also very reliable, if properly taken care of.
BTW the 520/820/530/830 rigs do need to be serviced occasionally for cleaning, lubrication and alignment. I recommend two years, but I own a shop! Most rigs come in about every 5-10 years.
The best thing you can do for your vintage rig, besides giving it a good blowout (preferably outside!) and lubing the fan bearings (yes, you have to remove the fan to do this!) is to QUIT SMOKING if you do smoke. This is the single biggest killer of hams and their gear is cigarette smoke. Repair costs for smokers rigs in my shop is about double that of a non smoker that keeps his rig fairly clean (except for the dust bunnies of course).
The next best thing is to buy a VERY GOOD surge suppressor. Tube gear (and don't forget, this series is mostly solid state) is also prone to damage from line transients. I use the Isobar series and the APC UPSes, they are not cheap.. Figure on spending at least $49.00 USD for a good one. Stay away from the 9.95 specials. Might as well use an extension cord.
73!
Bill
Robert Mackie <bomack@...> wrote:What a wonderful review Ed - KF6YKM has given on the older Kenwoods! After owning and operating one of these radios one begins to wonder just how necessary all of the "advanced" features are in the new rigs. And durability? There's no comparison!

If you're really interested in a counter for your radio, try Allmost All Digital Electronics in Auburn, WA. http://www.aade.com/#dfd

Subject: [TS-520_820_530_830] Re: Soon to be owner of TS-520SE

Hi Gary!

This line of radio's are GREAT! I have owned a TS-820S, A TS-530S
and now have a TS-520S. I have also had a TS-570DG, so can do a
direct comparison.

These older radios are really built to last. They include a power supply and an inherent 'tuner' of sorts; Not to mention a SOLID metal case. Alot of newer rigs do not include a built in power supply or tuner and most are made of plastic.

The 520 line does not have an inherent digital frequency counter, but the analog dial works fine.

BTW, I found a place online selling counters JUST for these rigs, altho the price tag is a bit steep ($150ish). Some good working 520's themselves sell for this amount.

The older kenwood rigs do not do AM without modification (and then only receive SSB). They also do not have FM or wide band receivers as Bill mentioned.

Mainly, the newer rigs have alot of bells and whistles, but the irony is that the older Kenwood rigs sound as good or better on TX audio and receive as well as any other new fangled fancy do-dad rig.

With no DSP I simply use my RF GAIN to filter out the sound floor noise and get very clear and clean and LOUD audio.

These rigs tune my 80 meter dipole on 80-20-10 meters and my 40 meter dipole on 40 and 15 meters.

BTW, these rigs seem to not be too picky about the mic(s) you use. Hi or lo impedence mics all seem to sound fine.

And finally, the bottom line. For very few $ you can be in the HF world talking locally and around the world and just having a good ol time.

180. VFO-820 Problems

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2002-12-31 20:34:55 UTC
From: Bill Evans
Topic: 180 Message: 180

I have a VFO-820 that has always (since purchasing it new in about 1980) been "hard to start" when switching over from the main VFO in my TS-820S. Normally a " tap" on the top of the case will get it going and it stays on until I switch back to the internal VFO. I have had the unit apart several times - resoldering and checking connections, cleaning relay and switch (Deoxit) contacts, reseating the cable to the 820, etc: Never have found the problem, much to my chagrin.

Lately things have been getting worse. Some instability in the VFO-820 frequency (warbling) and it now takes a solid "rap" to turn it on.

Has anyone got any suggestions?

Bill VE4UD

181. RE: [TS-520_820_530_830] VFO-820 Problems

Yahoo group: TS-520_820_530_830 (2001 — 2004)

From: Bill
Topic: 180 Message: 181

Check the rear bearing area of the main tuning cap in the VFO. The
electrical spring copper contact gets very dirty and starts losing contact.
The cure for this is a small spray of contact cleaner and then a very thin
contact file. Take care not to bend he spring copper. This should solve
your problem because you seem to have done everything else.

I currently have two 830s xcvrs and love them. One has developed a quirk. I do not get any output (no ALC level)when the bandswitch is in the 28.0 or 28.5 MHZ position. The rig runs beautifully (around 100 watts out) on all other bandswitch positions (including the balance of the 10 meter band-- 29.0 and 29.5-- which are different bandswitch positions). Any thoughts on a remedy?

I don't recommend "soaking" bandswitch wafers with cleaner; it may make them swell up and either freeze or get difficult to operate. Rather, soak a foam-tip applicator (used for cleaning tape heads), then apply it to the metal parts of the switch rotor and contacts. Getting a little on the wafers won't hurt; a lot will however.

Bill and Bob:

Thanks for the advice.

I will carefully clean the contacts.

I just bought this rig about two months ago. Did use it on 10 for a CW contest. Problem is intermittent.

Will report back.

The 830 derives it's band-determinate signals from a VCO/PLL system. Could be a loop tuning issue or intermittant solder joint; or dirty connectors between boards.
If you cannot find the problem ping me and I will have a look at the service manual.
I have a repair shop in Colorado, see our QRZ listing for more information.

Hi Bill,
Don't know the correct protocol for this... but here goes anyway... I have a nice -830.. which I dearly loved... but when I went to Singapore, it went to storage in the garage... for seven and a half years.. I have not yet opened it up, but have it still in the original Kenwood box... My question is what you charge for a "start up" and general going over??? I hate the thought of just plugging it in after all this time and seeing what happens... If this is an inappropriate forum, please send me a private e mail to discuss.

Isn't this the situation where you use a variac to slowly bring up the
voltage to keep any capacitors from blowing up?

But also, I heard that electrolytic capacitors can go bad after many
years of not being used, so you might need to replace them all as a
preventative measure.

Roy

The JA style electrolytics in the 520-530-820-830 rarely fail. They are not available anymore as far as I know
Also I don't recommend the "variac" method for this rig as low line voltage could cause damage the low voltage regulators. I have never found a need to use Variac.
For re-forming caps, I have a 0-400vdc current limited supply that I can use with the filter caps and on tube rigs... you can hook this up with rig powered down and it doesn't hurt anything. If the caps are shorted, the power supply limits current to 200ma. Old Eico thing...
Best thing is a good physical inspection (all covers off), make sure the tubes are seated, lube fan and vfo shaft bearings, power up on receive with dummy load and make sure nothing arcs, then try transmit at low power for a bit. Rig should run with covers off but not unattended for couple of hours to make sure nothing is going to blow up.

194. R820 Mods.

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-01-16 02:39:30 UTC
From: George Curtis
Topic: 194 Message: 194

Hi all,

I recently acquired a TS-820S/R820 station and I am in the process of cleaning and restoring the R820. I see that some mods have been added, namely the addition of a 12V fan on the counter unit and a regulator board (9V to 6.3) next to it. The fan was loud so I dropped the voltage down to 7V to run it quieter. Has anyone else experienced this mod. ? I question its necessity. Also the PTO case was wrapped with this reality sticky form foil (what?s the point of that). I removed it and cleaned it up.

Also, looking for a copy of the manual for R820. I have the service manual if anyone needs it.

Thanks

George K9GQ

George,
The fan may have been added to deal with a heat problem. Shut it off and see what happens. OK on the foil; people do all sorts of wierd things. Best to take all that stuff off and start "clean".
Good luck and keep us posted! You have a rare combination there.

Hi Bill,

Thanks for the reply, on another subject.... Refinishing cases, I am leaning toward giving them a good cleaning with a mild detergent and spraying with a clear coat if possible. However some items may need repainting. Rust-Oleum makes a spray can product called Pewter Gray which I have spray a few test strips and it looks very close to the light gray cabinet color. Anyone have any experience using this product.

George

197. Problem with VFO-820

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-01-20 15:09:26 UTC
From: José Pedro Alvarez C.
Topic: 197 Message: 197

Hello all,

My TS-820S with VFO-820 has developed a problem and I hope the members of this forum can help me out figuring what is wrong.

I had been using the rig without the external VFO but I tested them together when I bought them a couple months ago and everything was working fine then.

Yesterday I tried the external VFO and when I switched it on, either in the VFO or the radio, the display wnet blank and the receive audio went silent. The led indicating the external VFO lights OK.

Any ideas?

73's

Jos? Pedro CA3RVF
Santiago, Chile

198. RE: [TS-520_820_530_830] Problem with VFO-820

Yahoo group: TS-520_820_530_830 (2001 — 2004)

Topic: 197 Message: 198
Attachments: 1 described; binary payloads are missing from this source WARC

Without the vfo, the socket that accepts the vfo,
has to be jumpered. I believe it is pins 1 & 8.
Check your manual for the exact pins. Without these
2 pins jumpered, the receiver will go dead and the
display will blank out. Just what you are experiencing.

Using the external VFO, internal wiring or switching
will perform this task acting as the jumper. I think
possibly, the vfo cable (most likely) is no longer
performing this task. Check the cable pin to pin and
look for shorts in the cable also. If the cable checks
out ok, then you will have to go into the vfo and look
for the cause.

199. Re: Problem with VFO-820

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-01-21 15:04:08 UTC
From: José Pedro Alvarez
Topic: 197 Message: 199

Thanks for the reply, I will start by checking the cable.

Maybe I did not explain myself clearly, probably because english is a second language to me.

I have the radio and the VFO conected. The radio works fine, that means that the pins in the back are shorted correctly. But when I switch the VFO on with the switch onthe VFO or by the switch on the radio (receive in the external VFO) the VFO LED goes off in the radio and on in the external VFO but the display goes blank and the speaker goes silent.

If the problem is the cable, is ir possible to get a replacement?

Those connectors look like very hard to find.

Thx again.

Jose your english is fine!
Maybe bad VFO in the rig. Sometimes the rotor contact gets dirty and they quit working. Can you check the VFO output with a scope?

Pedro:

I have had a similar problem with my VFO-820 for years. Posted it to the group just before Christmas. I could make my VFO-820 come on by "tapping" the case, most of the time.

Consensus is that the rotor wiper is not making proper contact and should be cleaned.

Good luck. Let me know how it turns out, as i haven't had time to pursue my problem yet.

Jose,

Reading ur post again, it is not necessary to switch the radio to VFO-R when using the external VFO. I have the TS-520 and TS-802s and neither radio requires switching to VFO-R when using the external VFO.

Tried it a few times. So, basically, I guess I don't understand why the VFO-R
switch is there. But, you do not have to switch to VFO-R to use the external
VFO at least on the (2) radios I have. Anyone know why the VFO-R function is there?

Hi Jack,

I don't know whether you are familiar with the 520, but the drive level control works as preselector on receive, so you should try to adjust the drive level until the noise level increases...

I am guessing that you are re-tuning the preselector when you move above .200, and it just isn't cutting it.
Have to take a look at your VFO output, see if it's dropping off above .200, that's about the only thing that could do that unless the first IF passband is way out.

207. [TS-520_820_530_830] Using a YG-445c-1 in a TS-830s

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-01-24 15:56:11 UTC
From: r tg
Topic: 197 Message: 207

Does anyone know if you can use the YG-445c-1 unsoldered from the PCB and solder it in on the 830 IF board?

Tnx,

Rob

I think the c-1 is a slightly different center freq than the 830 IF. If it will fit, try it. You will know by the sound if it's right or not... CW bandpass should be fairly low tone (750 hz CF). If the rig does not like the filter, it will sound very tinny.

The recommended filters for the TS-830 are the YG-455c and YG-455cn.
Center frequency is 455.7 khz

The YG-455c-1 and YG-455cn-1 are for the 850/930/940/950 radios-
Center frequency is 455.0 khz.

Jack,
Sometimes old radios just respond to loving care... Often I have found that cleaning something fixed something else. Actually I guess we "disturb" the system and that fixes a lot of problems.
Radios hate to be left on the shelf.

Thanks Randy.
I tried a yk88c (not C-1) in my 850, and with the higher center frequency, it sounded like a RTTY filter! but not quite high enough. Still enough to shake a filling or two out of my mouth, hi!

215. For Sale

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-01-26 17:00:12 UTC
From: Charles Feigley
Topic: 186 Message: 215

Hello,
I have the folowing for sale:
Kenwood TS-520SE with the matching VFO-520S
external vfo and the SP-520 external speaker. Radio
covers 160 - 10 meters and has 100-120 watts out.
Comes with manual , no mic but will include mic. con.
All you need is a mic and antenna and you are on the
air.
Price is $250.00

AADE digital dial for Kenwood 520S and 520SE.
Comes with all connecting cabels and instructions.
Shows freq and mode.
Price is $100.00

Bilal Isotron 80 and 40 meter combo antenna. Small
limited space antenna system for the 80 and 40
meter bands. Not as good as a half wave diapole
but they do work. Includes instructions.
Payed over $170.00
Price is $50.00

Prices do not include shipping.
Thanks,
Charlie W4CDF

216. 6146 Warm Up

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-01-27 17:13:54 UTC
From: rsakabu <rsakabu@pwav.com>
Topic: 216 Message: 216

Hello Group,
How long do you let your 6146B's warm up before tuning up and transmitting? I saw one data sheet that said 6 minutes, some folk say that they just turn on the heaters an start talking, others say they know of people that never turn their rigs off, ever.

If you intend to do some talking here and there over a weekend, what is the cutoff where you would turn the rig off? One hour, 4 hours, overnight or just leave it on always? The 830 draws 35 watts with heaters off and nearly 300 watts with full TX, so with heaters on and the AF volume at a moderate level, I would guess that it averages less than 100 watts. Over an entire weekend, that's less than 50 cents worth of electricity, so I wouldn't be worried about the cost of keeping it on if it's gentler on the tubes.

Any advice, opinions, experiences?

Thanks and 73
Roy

217. RE: [TS-520_820_530_830] 6146 Warm Up

Just for curiousity, I don't think it will make any
real difference, tubes on or tubes off. I have always
read or heard that when electrical devices are left on,
and allowed to thermally settle down, the devices will
last longer. NASA supposedly does this.

However, this is with solid state equipment for the most
part. Tubes however, are a different story. Tubes have
a definite filament life rating in hours. Leaving them
on all the time will add up. On the other hand,
the filaments will not suffer as much from the thermal
shock of heating and cooling (in theory anyway).

Bottom line, I transmit ASAP when I turn the filaments on.
I even start to transmit while the filaments just start to
come on and is not even visible yet as a glow! If the tubes
go soft, there are many sources to get them from. Turn the
rig on, leave it on or shut it off. Have at it. Don't sweat
the small stuff.

Bill

218. Re: [TS-520_820_530_830] 6146 Warm Up

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-01-27 18:04:46 UTC
From: Stan Bruederle
Topic: 216 Message: 218

When I turn on my TS-820 heaters, I usually have to wait just a few minutes. I just times it and had 60 ma in one minute. Two minutes would seem to be as much warm up as is necessary. But by then the plate current is at 60 ma which I interpret to mean that I can transmit. I leave the heaters off until I am ready to have some QSOs. If I am just listening I leave them off. I expect there is some risk in that but I haven't missed any opportunities so far.

Regards,

Stan

Hi Roy,
I will turn mine off at end of the day. It takes too long for my old Swan to stabilize. With the Kenwood hybrid rigs, I would shut the radio off if I were leaving the house (i.e., work) for more than a few hours.
I don't like leaving tube gear on all the time, as tubes have limited life and turning them off at night will result in lots longer tube life.

There is a 9 volt supply that feeds the receiver circuits, sounds like you grounded it out somehow. You will need to find a schematic or service manual to repair this one, or find a good tech to fix you up.

229. Filter Cap source for TS-830S

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-02-08 13:16:14 UTC
From: Bill Gregory <william.gregory5@verizon.n
Topic: 229 Message: 229

Good morning all...
The filter caps (100uf/500v) C22/C24 had gone on my TS-830S.
In searching for replacements, I've been told that the part
is no longer available. Have tried several repair shops/part
suppliers with no success.
Does anyone know of sources which might have the part or
a substitute?

Tnx... 73 Bill K2EKM

230. RE: [TS-520_820_530_830] Filter Cap source for TS-830S

Yahoo group: TS-520_820_530_830 (2001 — 2004)

From: Ariel Katz
Topic: 229 Message: 230

Bill:
Please try those sources for this cap, you will find it for sure!
Atlantic Coast Parts (NY): www.kenwoodparts.com
Pacific Coast Parts (CA): www.pacparts.com

It is about $ 17 e.a.and those are original, so will fit exactly on your rig.
Good Luck and enjoy your TS-830S!!

LU4OO, Ariel (Salta, Argentina)

Try East Coast Transistor at (800) 637-0388 or Pacific Coast Parts at (800) 262-1312. If it fits into a Kenwood one of these two is very likely to have it.

Ariel and Mike,
Thanks for the leads... I had checked with both those places
last Friday and neither had any more in stock.
I also called Kenwood Service Center East in Virginia Beach, VA,
and the fellow said that if a customer sends him a transceiver
with that problem, he returns it, as he can't get the parts either.
Think he said that they were just discontinued last year, so guess
my timing was bad :)
Guess my main hope is to pick some up at a hamfest this spring.
I'll try to get to Dayton this year, so maybe I'll get lucky.

Looks like the Kenwood will be collecting dust again unless I
get lucky.

Thanks again guys. Best wishes es BCNU.

Bill

235. After a long sleep...

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-02-10 12:51:17 UTC
From: f x
Topic: 235 Message: 235

Dear Group...

I have seen some threads about what happens after long storage... Thought I would share my experience...

In July 1995, I went QRT and moved to Singapore... The TS-830 was stored in its original factory box... It resided in a garage in the Texas panhandle for seven and a half years, subject to the vagaries of weather (heat and cold, but low humidity), untouched.

Yesterday, the bug (no pun intended) bit me, and the rig was unpacked. Rummaging through the odds and ends, I uncovered a G5RV antenna.. slapped it up with the ends about as high as I can reach, middle at maybe 15 feet or so..

With trepidation, I plugged it into the mains and flipped the ON switch... to my delight, it came right up and in short order I was copying CW again... Finally, the acid test... ON with the heater switch, wait a few minutes and key down and tune... To my utter delight, I am getting about 90+ watts out of my MFJ tuner... and just to prove that the power is real, I worked OK2 and VK6 on 40 CW this morning... this from a 9-land QTH...

Only thing that seems a little "off" is the CW narrow position... the output is very very low... seems to be a lot of loss in that circuit... otherwise, ALL functions seem to be working... am considering sending it to Bill for a complete alignment, just to be sure, but it seems just as good as seven years ago.... Kenwood builds solid stuff!!!!

237. Heil HMM-K Dual Cartridge Mic For Sale

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-02-11 11:59:01 UTC
From: Jingofl <ae4hl@earthlink.net>
Topic: 237 Message: 237

I have a new Heil HMM-K (4 pin) mic for sale. It has a high impedance transformer installed by Bob Heil himself. The mic has the selectable rag chew and dx dream machine cartridges. The mic is new. I spent close to $100 getting this mic setup for an older high-impedance Kenwood (TS-520SE). The reason I am selling is that I got tired of waiting for it to arrive and purchased a dynamic mic and mixer and now feed my audio into the phone patch in jack.

I will take $65 (including shipping)

Thanks.

From: rtg222 <rtg222@yahoo.com>
Topic: 238 Message: 238

I got a 830s in good condition but the fan is much louder than on my 820. Also it moves a lot more air than the 820. Is this normal?

I have lubricated the fan and that does not seems to help the noise aspect of it.

I am guessing it needs replacement.

Anyone have a spare laying around? I also need a T/R relay.

Tnx,

Rob - WR1N

Topic: 238 Message: 239

Those are getting rare.
You may need to adapt a computer fan to the back, and run 12v from the rig to the fan connection.
If you can't find one to match the screw pattern, silicone some magnets on the fan housing (check airflow direction first), then let it cure, and then just stick it on the back of the rig.
You may also be able to find a fan small enough to fit inside the original fan housing. The new 12v fans move more air than the 120 ones did

Hi all, I'm new to this group. I'm looking for a NICE TS-830 tranciever, VFO, Speaker and mic. I currently have an ICOM-746 that I'm selling but will be able to purchase an 830 station if the price is right and in good condition.

The XYL says I can do this and replace the money with the 746 sale HI HI.

Please contact me if you have anything that I can build this station with.

Thanks - Jack KF4YIO

Topic: 244 Message: 245

Hi Carl,
You could try the site www.kenwood.net, amateur radio page,
go to service centers.
Appears that www.pacparts.com has some panel switch parts which
are still available.
YOu can also try partsolver.com, but I just did a lookup on
ts-520S and they don't have much.
You can also try contacting some of the listed service centers
for help on locating parts.
Good luck... one of the problems w/the old gear is part availability.
I'm currently trying to hunt down suitable replacements for the
filter caps in my old ts-830S.
Another good option is a spring hamfest.

The switches are kenwood part number S44-2020-05.
These are the switches only, you also need the plastic toggle part. I don't see that part number in the service manual.
I have one of the switches here.

I believe you are talking about the power plug. Therefore, these are
available from Newark Electronics. They are on the web.

Thanks,
I checked Newark, and they have the male connector. I am looking for the female 12 pin socket used on the power cord. Newark has a few connectors, but no sockets.

Keep in mind, the American Jones plugs are numbered in reverse of the JA plugs!
Ran into this on my FT-101 and I think it's the same with the Kenwood. Check everything with an ohmmeter before plugging it in, if you are homebrewing an AC power cord.
Kenwood/Pac Coast may still have the assemblies available, no?

265. YK-88C Attenuation

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-02-19 04:35:03 UTC
From: Alan Wormser
Topic: 265 Message: 265

I have a TS-830s that already ahd the YG-88C 455 kHz CW filter. I just installed the YK-88C 8.3 MHz cw filter, and now the received signal is attenuated on the narrow CW setting - perhaps by 10 to 20 dB. That wasn't the case with just the YG-88C installed.

I also notice that the signal peaks when I have IF shift about 1 tick mark off-center to the left (minus side). I had noticed this before when I had the YG-88C by itself, and that the more I narrowed the VBT, the more I had to peak the IF shift to the left to track the station.

So, is the attenution normal? I don't expect so, since it makes weak signals disappear -- the opposite of what I wanted!

Any ideas before I mess something else up?

Alan N5LF

266. Re: [TS-520_820_530_830] YK-88C Attenuation

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-02-19 15:50:33 UTC
From: r tg
Topic: 265 Message: 266

Perhaps just a typo but the correct 455kHz(2nd IF) filter is the YG-455C filter and the correct 1st IF filter is the YK-88C.
If you do infact have the YG-88C installed in the 2nd IF location? I would expect alot of attenuation from that filter by itself if this is the case.
Good Luck,
Rob - WR1N

267. VFO-230 Display and Sound

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-02-19 15:59:09 UTC
From: r tg
Topic: 267 Message: 267

I have just completed repairing the power supply on a defective VFO-230. It works with the 830 just fine but two issues seem to be left.

1 - A couple of digits on the display are faint. Anyway place to look at the driver or PS for the display tube or is a new tube required. The display shows the correct numbers just faint.

2 - Is the unit supposed to beep? If so, when? I get no tones and there is a componet that looks like a piezo buzzer on the PS board.

Other than that it works great. BTW, the PS design is poor. It is a linear design and uses resistors to dissipate power when going from a higher voltage supply to a lower voltage supply and one resistor R10 270ohm is underated for it's power dissipation.

TIA,

Rob - WR1N

Double check your soldering around the filter pins.
You should not see more than 1 s unit decrease in signal when turning on the narrow filter (at passband center). It's quite possible that you have a bad filter; or, the filter select function is not configured for having the optional filter.
I think there is a jumper you have to move on a connector on the IF unit when installing narrow filters, no?

Have never heard an 830 beep.
The power supply board is actually pretty reliable. The resistors should not be overheating. Also, they act like fuses when something goes wrong in the PA. Don't oversize them or more damage will result if you get a tube failure.
The display tubes for these rigs are getting to be hard to find.
Also on the tube circuit board, there are two-100 ohm 1/2 watt resistors for the screens; these should not be "upsized" for the same reason. These are your "screen fuses".

Bill,
Thanks for the reply. In my early post I was refering to the VFO-230, not the TS-830S.
The VFO-230 has the PS design issues, from what I can see, and has the peizo componet.
Tnx,
Rob

272. Re: [Kenwood] YK-88C Attenuation

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-02-20 05:34:33 UTC
From: Alan Wormser
Topic: 272 Message: 272

Thanks for the quick replies. Yes, it is the YK-88C and the YG-465C (not the YG-88, which is the 8.8 MHz IF filter for the TS-820, not the TS-830). I was typing faster than my brain -- a common Internet malady in Newsgroups.

Looks like it's nearly unanimous - receiver alignment.

Will check CW4 jumper--that'd be too easy. Then do the (easier) alignment in the Owner's Manual. Then to the Richard Measures' article and the Service Manual --- with help from friends with the right test gear.

I'm gonna learn this rig, or kill it trying...

But there's always Plan "D": Box it up & ship it to Avvid (if they'll still take it). But I won't learn as much by doing that. Wish me luck, and anyone with warning of pitfalls - bad instructions in the manuals, etc. - please let me & the rest of us know!

Thanks to all who replied!

Alan N5LF

Bill,
Yes, the CW filter is installed... As I have fiddled around with various settings, I find that most likely the IF is off just a tad... If I shift the passband a little, the CW filter (narrow) comes to life... and I have to make SURE that the VBT is wide open, else no signal to the narrow filter... so it probably needs a little tweak.. as soon as the contest is over this weekend, I will box it up and send it along for a thorough check up and alignmen... I will be gone the following two weeks anyway and will provide shipping details in an enclosed letter... (don't want the rig to get back before I do..)

Dear Group...

I have seen some threads about what happens after long storage... Thought I would share my experience...

In July 1995, I went QRT and moved to Singapore... The TS-830 was stored in its original factory box... It resided in a garage in the Texas panhandle for seven and a half years, subject to the vagaries of weather (heat and cold, but low humidity), untouched.

Yesterday, the bug (no pun intended) bit me, and the rig was unpacked. Rummaging through the odds and ends, I uncovered a G5RV antenna.. slapped it up with the ends about as high as I can reach, middle at maybe 15 feet or so..

With trepidation, I plugged it into the mains and flipped the ON switch... to my delight, it came right up and in short order I was copying CW again... Finally, the acid test... ON with the heater switch, wait a few minutes and key down and tune... To my utter delight, I am getting about 90+ watts out of my MFJ tuner... and just to prove that the power is real, I worked OK2 and VK6 on 40 CW this morning... this from a 9-land QTH...

Only thing that seems a little "off" is the CW narrow position... the output is very very low... seems to be a lot of loss in that circuit... otherwise, ALL functions seem to be working... am considering sending it to Bill for a complete alignment, just to be sure, but it seems just as good as seven years ago.... Kenwood builds solid stuff!!!!

Raleigh,
Someone on the Kenwood reflector list had what sounds like a similar
problem, maybe you don't want to or can't work on the alignment part,
but read on. You could do a physical inspection of the IF section and
see if this fix works for you.

_____
Original post:

I have a TS-830s that already ahd the YG-88C 455 kHz CW filter. I
just installed the YK-88C 8.3 MHz cw filter, and now the received
signal is attenuated on the narrow CW setting - perhaps by 10 to 20
dB. That wasn't the case with just the YG-88C installed.

I also notice that the signal peaks when I have IF shift about 1 tick
mark off-center to the left (minus side). I had noticed this before
when I had the YG-88C by itself, and that the more I narrowed the VBT,
the more I had to peak the IF shift to the left to track the station.

So, is the attenution normal? I don't expect so, since it makes weak
signals disappear -- the opposite of what I wanted!

Any ideas before I mess something else up?

_____
Follow up:

Problem solved! Thanks to all who responded.

After quickly checking the 6 solder points of the YK-88C filter, and
that the jumper was set to CW4, I did the first steps in aligning the
receiver - per the TS-830 user's manual. The only slugs that seemed

to make a difference in volume of the sound coming out the speaker were T2 (RF Board), and L3,L6, and L7 (IF Board). The others (L2, L4, L5, and L11 on the IF Board) didn't seem to have any affect -- at least using the crude methods of tuning by ear for max noise (AGC off) or by using the 25 kHz XTAL marker & watching the S-Meeter with AGC turned to "fast."

Note that although L12 is mentioned in the Users Manual alignment procedure. it is NOT mentioned in the procedure shown in the Severice Manual, nor does it appear on any diagrams from either manual.

So I peaked T2, L3, L6, and L7 and left the others where there were. There may have been some improvement in audio, but it is very slight. Because of the next discovery, I didn't finish the realignment.

I then looked more closely at the underside of the IF board, where the YK-88C filter is soldered. Using a magnifying glass, I finally saw that the problem: A trace/pad had lifted off the printed circuit board, and slid sideways close enough to short out the two pins at one end of the filter. So, I reheated the solder and used the tuning tool to shove the pad back into position, separating the two pins.

When I tried the TS-830, my attenuation problem was gone. Now insertion loss is less than 1 or 2 dB -- less than 1/2 S-unit according to the S-meter.

Good luck
Roy

278. ts530sp mic

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-03-02 08:09:06 UTC
From: Nigel <nhead@cwctv.net>
Topic: 278 Message: 278

hi everyone i have a ts530sp the mic
that came with it is a cb hand mic i
am not sure whether this is working
well with the rig as i have had
several comments of audio could be
louder. could anyone tell me if
there is a better type of mic i
could use to help improve my audio.
all the best nigel m0dbo

279. Re: [TS-520_820_530_830] ts530sp mic

Hi Nigel,
i use the kenwood mc50 with mine, the cb one you use is probably
only a low impedence mic and you need to get a hi z type .
The handbook does say either a low (500 ohm) or a high (50k ohm) can be
used, but i have never had good results with a low imp type.
Sure some others members of the group will give you more advice

Dear Group...

I have seen some threads about what happens after long storage... Thought I would share my experience...

In July 1995, I went QRT and moved to Singapore... The TS-830 was stored in its original factory box... It resided in a garage in the Texas panhandle for seven and a half years, subject to the vagaries of weather (heat and cold, but low humidity), untouched.

Yesterday, the bug (no pun intended) bit me, and the rig was unpacked. Rummaging through the odds and ends, I uncovered a G5RV antenna.. slapped it up with the ends about as high as I can reach, middle at maybe 15 feet or so..

With trepidation, I plugged it into the mains and flipped the ON switch... to my delight, it came right up and in short order I was copying CW again... Finally, the acid test... ON with the heater switch, wait a few minutes and key down and tune... To my utter delight, I am getting about 90+ watts out of my MFJ tuner... and just to prove that the power is real, I worked OK2 and VK6 on 40 CW this morning... this from a 9-land QTH...

Only thing that seems a little "off" is the CW narrow position... the output is very very low... seems to be a lot of loss in that circuit... otherwise, ALL functions seem to be working... am considering sending it to Bill for a complete alignment, just to be sure, but it seems just as good as seven years ago.... Kenwood builds solid stuff!!!!

Keep an eye out for any of the Kenwood desk mics, MC-50, MC-60, etc.
The Shure 444 is reasonably priced and works well.
The Astatic 10DA head on a UG-8 stand is snazzy looking and works well.
Hand mics, look for the MC-43 and put a 4 wire plug on it.

285. Help wanted from New Ham & 520 user

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-03-03 04:34:36 UTC
From: kmbadlose <ve3bhp@rac.ca>
Topic: 285 Message: 285

Hi All:

So happy to have been able to find this group. I just recently got my Amatuer licence here in Toronto,Canada and after much research and rave reviews from users old and new chose to buy a TS520S as my very first rig to get started in this wonderful hobby. I have found many helpful posts in this group already.

I have a question that I hope is not too basic, but I hope someone can give me the more than likely obvious answer to. In going through the manual for the tune up and calibration settings everything is fairly straight forward although I am having a hard time understanding what the "plate control" does and how I am to set the indicator up for first use. What I mean is,that I have noticed that the knob has no clockwise or counter clockwise stopping point like all the other controls. How do I know if the plastic ring with the pointer is set correctly? I have noticed that it (the plastic ring indicatior) is able to be shifted independently of the knob. Any help with how to set this correctly for the first time would be greatly appreciated.

Also,I have a MC-60 mic that I'd like to convert for use with the TS520S. Is there a ready made adapter for this configuration, or will I just need to get a 4-pin mic plug and re-wire it appropriately.

Topic: 285 Message: 286

Hi Peter,
The PLATE control is on a "vernier" or "planetary" drive, which makes it easier to get a more precise adjustment.
The control goes round and round because the tuning capacitor to which it is attached has no stops. It will not harm the system to do this. You will notice once you get the radio tuned, there are two places where you will get the same results; where the marking for the band is correct, and on the opposite side where there are no markings.
As for whether it is right or not, just tune up per the book, and see if the pointer is somewhere near the proper band marking.
The function of the tuning control is to "resonate" the plate output tank circuit. It does this by varying the variable capacitor against the plate tank inductor so as to set up a parallel resonant circuit for the tube plates to work into. This is the input side of the "pi network" output circuit.
The loading control is also a variable capacitor. It is the "output end" of the pi network and sets up a SERIES resonant circuit for the plate tank circuit, to transform the high impedance of the plate circuit to the low 50 ohm impedance of the antenna circuit. Thus you get efficient power transfer when everything is matched up.
Read more about inductance, capacitance and resonance in the ARRL Handbook, most any year.

Thank's Bill for the quick response:

Makes alot more sense now. It'd help some of us newbies if Kenwood would have thought to put info like this into their manuals.

I'll probably have alot more questions as I go along, hope you don't mind.

Subject: Re: [TS-520_820_530_830] Help wanted from New Ham & 520 user

Hi Peter,

The PLATE control is on a "vernier" or "planetary" drive, which makes it easier to get a more precise adjustment.

The control goes round and round because the tuning capacitor to which it is attached has no stops. It will not harm the system to do this. You will notice once you get the radio tuned, there are two places where you will get the same results; where the marking for the band is correct, and on the opposite side where there are no markings.

As for whether it is right or not, just tune up per the book, and see if the pointer is somewhere near the proper band marking.

The function of the tuning control is to "resonate" the plate output tank circuit. It does this by varying the variable capacitor against the plate tank inductor so as to set up a parallel resonant circuit for the tube plates to work into. This is the input side of the "pi network" output circuit.

The loading control is also a variable capacitor. It is the "output end" of the pi network and sets up a SERIES resonant circuit for the plate tank circuit, to transform the high impedance of the plate circuit to the low 50 ohm impedance of the antenna circuit. Thus you get efficient power transfer when everything is matched up.

Read more about inductance, capacitance and resonance in the ARRL Handbook, most any year.

73!

Bill

Hi All:

So happy to have been able to find this group. I just recently got my Amatuer licence here in Toronto,Canada and after much research and rave reviews from users old and new chose to buy a TS520S as my very first rig to get started in this wonderful hobby. I have found many helpful posts in this group already.

I have a question that I hope is not too basic, but I hope someone can give me the more than likely obvious answer to. In going through the manual for the tune up and calibration settings everything is fairly straight forward although I am having a hard time understanding what the "plate control" does and how I am to set the indicator up for first use. What I mean is,that I have noticed that the knob has no clockwise or counter clockwise stopping point like all the other controls. How do I know if the plastic ring with the pointer is set correctly? I have noticed that it (the plastic ring indicatior) is able to be shifted independently of the knob. Any help with how to set this correctly for the first time would be greatly appreciated.

Also,I have a MC-60 mic that I'd like to convert for use with the TS520S. Is there a ready made adapter for this configuration, or will I just need to get a 4-pin mic plug and re-wire it appropriately.

I think Kenwood's approach was that back then, tube rigs were the norm and anyone buying them MUST know how they work! hi hi
Actually the pi output network is a facinating thing and bears study to truly appreciate it. Best to get one of the older handbooks (1988 back to about 1955) and study all you can about tube matching networks etc...
I am thinking of modding a SB-200 amp to take 2 each 4cx250b tubes... more efficient on 10m!

289. TS-820 Demystification

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-03-06 17:23:33 UTC
From: overthepole
Topic: 289 Message: 289

Greetings Group,

I just came across this group and am glad to have found it. I own and operate a TS-820 and I really enjoy it. It was my first HF rig, my HF Elmer sold it to me and I've been using it off and on for the last 12 years. I just set it back up after having moved into a space that allows me to run high power and have the yagi back up. I've been an apartment dweller recently and I've been using the Yaesu FT-817 to stay out of the neighbor's appliances, etc. It was fun, I love the rig, but I'm glad to be back on tubes again. I always get outstanding audio reports from the 820 and enjoy the ritual of tuning it up. It's confirmed over 120 countries for me and I'm pretty loyal to it.

Over time, I've wished that someone I knew had a plethora of knowledge about the quirks of the 820. I seemed to have found a great resource here and hope you all don't mind if I ask a few questions. Some of them are basic, but I haven't used the radio in awhile and need to get back in the groove, others are things from the "I've always wondered about that" file.

My set up here is the 820 running through an MFJ-949E tuner out to an Explorer 14 at 55 feet. Both the radio and tower have their own ground rods.

First, let's talk tuning. I've always tuned the radio into a dummy load fist, with the carrier knob lowered until I get things up to snuff. I've always understood the relationship between the Plate and Drive. I peak the Drive and dip the Plate. I do this back and forth a few times until the SWR looks minimal into the dummy load. Then I add carrier to get the power up and tweak the Plate and Drive as needed. I then run the carrier up so that in CW on key down it shows an IP of 230 mA. Is that value correct? Is it higher?

Notice in this process that I never mentioned the Load knob. It seems to adversely affect my tune when moved and so it remains stationary. Can someone demystify the Load knob? There are instructions in the manual about using the send and adjusting it for max deflection, but there is no deflection when I follow their instructions. Am I doing something wrong here?

I think there is a fine line between thinking that the radio has a problem and the problem actually being located between the key and the chair! ;)

Also, the radio seems to be "moody". Some days when I fire it up the meter light flickers a little after turning the heaters on and it seems to put out less than full power. I can't quite get it up to the usual output. I always allow the rig time to warm up, so I know it isn't that. I let the rig run with just the power on for 10 minutes or so, then turn on the heater for 10 minutes or so before tuning up. The best way to describe it is that sometimes it just doesn't seem to come all the way on. It works fine; just the power levels are not as high and the meter response on transmit doesn't seem as lively. Thoughts? Also, after it has been on for most of the day it seems like the audio begins to get a hum in it. It's slight, but everyone's audio seems a bit dirty. Something in the audio circuit drifting perhaps?

Tubes. I believe the tubes in this radio might be the originals or maybe the second set. (The rig will celebrate its 25th anniversary this year. 25th is the glass anniversary isn't it? ;) If replaced I'm told I can use 6146B's. The service manual mentions another tube used as the driver for the two finals. Is there a common replacement for this one as well? Is changing them as simple as pull the cover, swap `em out and away you go? Is it worth it to spend a few extra bucks and get a matched set? Can anyone recommend the best brand and resource for purchasing new tubes? I'm thinking that these tubes might be getting old. The output power seems to be lower even when operating at low SWR and key down plate current is 230 mA especially on 10M. How can you tell if the tubes need to be replaced? Again, here is the fine line between my thinking they're tired and the possibility that I'm not tuning the rig correctly. I have however, been very careful not to abuse the tubes. Any tips on these issues?

Also, I show a HV reading on key down of 900V. Correct? I've also adjusted the idle current back to 60mA. It had worked its way up to 70mA over time.

The radio has the Freq. Counter option installed. I've had to pull it numerous times to clean the contacts after it started giving me random values. Today, it goes back and forth between being accurate and just showing 9.000.0. I read that the 9.000.0 value is due to no input to the counter. Anyone figure out a solution for cutting down the amount of fussing with this or is it just one of the joys of ownership? I also have the remote VFO-820 connected. I can sometimes correct the situation by wiggling the connectors for this, but it doesn't always seem to be the cause.

Also, the VOX doesn't want to work. I can't get it to activate. I've though about trying to use it although I enjoy the ritual of keying a mic and don't think I want to cycle the transmit relay that much, so it's more of a "wonder why not" than an issue. Could it be the way I've wired the mic? I'm running an old Astatic D-104 that's sounds terrific I'm told, perhaps that has something to do with it?

Lastly, who is the repair guru for this rig? Who is THE person I should send it to if the need should arise?

Thanks for bearing with the degree of verbosity, but finding this group was like pay-dirt and I had a few questions stored up. With all the new fancy rigs hitting the market every year, I remain loyal to the 820. Perhaps I'll upgrade someday, but for now I'll stick with the tubes.

Thanks in advance for any and all assistance,

Best 73s,

Jeffrey

Morning guys. I had a problem with a 520 where the receive audio was slow to return when the PTT was released. I checked the "RL" terminal on the VOX board for 12 volts switching to the field of the PTT relay. It was okay but the audio was still delayed over a second. I then unscrewed the VOX board from the chassis. It's the one, second from the rear on the left, topside of the rig. The relay is a plug-in and is accessable after removing the VOX screws and moving the board aside. There's enough slack in the wiring so it's an easy operation. Once the relay is removed the clear plastic cover can be pryed off and the relay serviced. I found a small piece of metal jammed into the axle where the armature pivots. I sprayed tuner cleaner all over the relay, blew out trhe excess and reinstalled the cover. Once back in the rig with everything tighened up I checked the rigs operation. The T/R switching works like the rig was brand new! The piece of metal must have been laying in that relay since new (25+ yrs) and finally lodged in the axle when the rig was transported. The Kenwood Service Manual for the 520 outlines the removal of the relay very clearly.
Hope this helps.

Pete Carr WW3O

Hi Nigel,
Peak it up into a dummy load, see if you are getting 80-100 watts on CW mode.
Turn on the calibrator, and tune around 28.5 for a carrier.
Take top cover off, and on the coil bank on the RF unit in the right side of the radio, locate some cans with "28" on the board. There are three... in a line, front to back, toward the final cage.
Carve a plastic tool to fit the iron powder cores of the front two cans, and peak them for max receive sig on the meter.
Then carve another tool to fit the 28 coil in the back, near the PA cage.
TX in TUNE mode, and reduce carrier as needed to get the ALC meter off the peg.
Tweak the 28 coil nearest the PA cage for max ALC reading.
That's all ya need.

Hi Jeffrey,
Wow, you poured your guts out on this one... Welcome and thanks for your first post! I would like to respond to your questions, one at a time if you and the list don't mind... will change the subject line to maybe start some new threads over time.
Last question first: Good repair people. I know of several guys that love to work on the 820's, one is Clif of www.avvid.com fame. Another is yers truly at www.amateur-repairs.com , holler at us if you need us. There are several other really good repair firms in the US, also International Radio in Florida but I don't have their website. I am sure other members will pipe up with their favorites. Shipping is a consideration so if you can find a good tech in driving distance, by all means try him first.
73, and enjoy the group!

For the VOX to work, the mic input to the rig must be "hot" all the time. The mic audio circuit must not go through the push-to-talk switch on the handle. The base of the mic has a circuit diagram, just try jumpering across the switch N.O. contact that is in series with the mic element.

Tubes last longer than transistors if not mistreated!
Matched sets for the finals are not necessary, just make sure they are the same manufacturer. 6146B or 6146W. Surplus Sales of Nebraska sells the W's. If you can find NOS 6146B of any manufacturer, that is fine too. The B tube gives you 20 percent more plate disapation, but this is not consequential in SSB or CW operation, really.
You can run your plate idle current from 35-60 mA with no problem. This will creep around with line voltage, will be lower at dinner time when everyone is cooking.
The 12BY7A driver lasts about 1/2 as long as the finals; that is to say, they are good for 10 years instead of 20, hi hi... I gave a test method back in the archives; if you can't find it let me know. There is an easy way to test both the PA and driver tubes without even removing the covers of the rig.
Swapping tubes requires touch up on the RF deck alignment and possibly neutralization.
900v is normal for plate current.
How much power are you getting out of the rig on 20m and on 10m? use a good meter and a dummy load.
bill

I would go through the power supply and check for bad solder joints on the rectifier unit.. it's mounted center of rig, bottom, near rear apron, has a bunch of little silicon diodes and resistors on it...
Also may have bad power supply filter caps on the low voltage supply. Your Hi-V caps are ok because you are getting 950 volts on the plates.

Your explorer 14 should be tuned for the favorite part of each band, you should not be needing a tuner except for band-edge excursions. Get rid of the tuner if you can.
You should not be tuning for minimum SWR from the rig into the dummy load! That is the wrong parameter to be seeking.
Into the dummy load, with the tuner circuits out of the line, in TUNE mode... you peak your DRIVE control for max ALC indication. Reduce the CAR control as needed to keep it off the right hand peg. After you have done this, you don't touch the drive tuning control again. You will bring the power output up and down as needed with the CAR control.
After doing that, switch meter to Ip or plate current, and quickly dip the plate current with the plate tuning control. This resonates the plate circuit and precludes tube damage in the subsequent steps.
Next, switch the meter to RF output indication, and transmit. If you do not have any RF output indication, but an external meter indicates otherwise, there is an adjustment on the back of the rig just above the fan, for PO ADJ. Take the cover off, and rotate that until you get a useful reading (probably less than 1/2 scale at this point). If the meter jerks back and forth, the control is dirty; just operate it a few times and try to find a spot that works. We can clean it later if needed.
Once you get the RF output indication, you are ready for "max smoke". Switch rig to CW mode, turn the CAR control full CW and transmit. With both hands, quickly adjust both the plate TUNE and LOAD controls for max indicated output. They do interact. The LOAD control should be from 10 o'clock to 2 o'clock when you are done, into a dummy load. With an external meter you should see between 80 and 120 watts or possibly more. 120 on 20M and 80-90 watts on 10m is great. If you peak out at 50-60 watts, advance the LOAD control clockwise a bit and retune. If it's less, move the load control back. If it's more, advance the load control again and retune. do this until you see no improvement. This will leave your pi network at the optimum setting for best IMD (least distortion on transmit, less splatter). (Note: tube circuits really like to run at full bore for best results. If you want to try QRP, get a solid state rig).
Now, switch to your antenna (in rx mode of course). Repeat the last step into the antenna. Go for max smoke. NO TUNER. When you are done, quickly measure the swr with the tuner in bypass. I want to know what your SWR is at the favorite part of your favorite band, on the Explorer (that's a real good antenna, and real broad band for a yagi by the way). Again, the tuner is not good to have in the circuit until we get all these other issues resolved.
If any of these steps don't work or is confusing to you, let me know. If you can't get results, let me know.
b
overthepole <overthepole@...> wrote:...

My set up here is the 820 running through an MFJ-949E tuner out
to an Explorer 14 at 55 feet. Both the radio and tower have their
own ground rods.

First, let's talk tuning. I've always tuned the radio into a dummy
load fist, with the carrier knob lowered until I get things up to
snuff. I've always understood the relationship between the Plate

and Drive. I peak the Drive and dip the Plate. I do this back and forth a few times until the SWR looks minimal into the dummy load. Then I add carrier to get the power up and tweak the Plate and Drive as needed. I then run the carrier up so that in CW on key down it shows an IP of 230 mA. Is that value correct? Is it higher?

Notice in this process that I never mentioned the Load knob. It seems to adversely affect my tune when moved and so it remains stationary. Can someone demystify the Load knob? There are instructions in the manual about using the send and adjusting it for max deflection, but there is no deflection when I follow their instructions. Am I doing something wrong here?

Radio works fine. The counter just has off days. One day it's dead-on, next day it's giving me random values, another day it will just show 9.000.0 or 29.000.0 depending on the band.

Also, the only time that everyhting goes away is when something is up with the connector to the VFO-820. Moving that around can cause receive and display to vanish.

Thanks Bill for the info. I'm going to try all the tuning steps and see if I can get this thing to sing. Power-wise I'm only getting 50 -60 watts on 40, 20 and 15. It was more like 25 on 10, but let's hold it until I tune properly!

What is the maximum plate current? Is 230 mA correct?

I'll also look for your trouble shooting guide for the tubes and go through that.

I'll keep you posted!

The VFO signal "y's" out to the VCO/Divider unit to feed the counter, and to the Mixer unit to feed the rest of the radio.
I am thinkin that the VCO/Divider board interconnects need to be cleaned.

Bill,

Here are the results from tuning it on 40M just now.

When peaking the Drive for max output on ALC, the meter starts
out high and falls off pretty rapidly. This normal?

When dipping the Plate the same thing happens only slower rate
of decent.

So, on 7.225 I'm showing an output of 125W on the external
meter, with an IP of 250 mA and an SWR of 1.5:1.

Perhaps if you can come up on 40, you can hear it. Let me know.
I've got 7.225 on right now.

Jeffrey

311. Low Power on 10M

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-03-10 04:09:51 UTC
From: overthepole
Topic: 311 Message: 311

I encountered difficulty when trying to tune for 10M. On the first tuning step, when setting the mode to Tune and the meter for ALC, then flipping to Send, there's no meter deflection whatsoever, so setting the Drive was a total guess. I more or less left it where it was for 15M.

I was able to proceed, carefully, from there and managed only to get 45W out at 130 mA IP with an SWR of 1.2:1. This was on CW keydown.

Then, when switching to USB, there was almost no power out until I cranked up the mic gain to finally get the mic to drive the radio. The mic gain is usually left alone across the bands, I don't adjust it. But I was able to get some response from the rig by turning it up.

The low power out may be because of poor tuning, which is due to the Drive being out because there's no deflection on the meter to set it.

Thoughts?

The rig tuned up on 15M with near identical values to the tune on 40M. I'll check 20M in the AM.

Getting closer!

Jeffrey.

312. Re: [TS-520_820_530_830] Low Power on 10M

HI... my 2c worth...
For all tube final rigs, here is a rule of thumb...Start with the Load control at minimum, i.e. counterclockwise... Go key down on CW on the desired band... while monitoring the plate current (Ip), rotate the Drive control for max plate current, and tune the Plate control for a minimum (dip)... now that the tubes are happy, you can increase the loading (Load control) ... after each increase of the load control, redip the plate since there is interaction... Also, keep your other eye on the power out function of your SWR meter...the peak of the power output should coincide with the dip of the plate current... if it does not, that is likely an indication that the finals need to be neutralized... (some parasitic oscillations going on in there)...

If the output on 10 meters is low there are several possibilities...
1. insufficient drive (may require retuning the internal drive coils, or a new drive tube)
2. Finals are "soft" i.e. old, or gassy...
3. Finals out of neutralization
4. Inaccuracy in the power meter reading on 10 meters..

Hope this is helpful.

Regards
NY0Y
Raleigh

Change the 12BY7 tube. Best to use a used one, from ebay or somewhere... get several, as one may be wild and you will need to swap one or two until you find one that is stable.

314. Re: [TS-520_820_530_830] Low Power on 10M

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-03-10 14:18:37 UTC
From: Bill
Topic: 311 Message: 314

Realign the 10M rf coils. See archives from about a week ago to present day. I detailed how to do this. If you can't find it let me know.
b
overthepole <overthepole@...> wrote:I encountered difficulty when trying to tune for 10M. On the first
tuning step, when setting the mode to Tune and the meter for
ALC, then flipping to Send, there's no meter deflection
whatsoever, so setting the Drive was a total guess. I more or
less left it where it was for 15M.

I was able to proceed, carefully, from there and managed only to
get 45W out at 130 mA IP with an SWR of 1.2:1. This was on CW
keydown.

Then, when switching to USB, there was almost no power out
until I cranked up the mic gain to finally get the mic to drive the
radio. The mic gain is usually left alone across the bands, I don't
adjust it. But I was able to get some response from the rig by
turning it up.

The low power out may be because of poor tuning, which is due
to the Drive being out because there's no deflection on the meter
to set it.

Thoughts?

The rig tuned up on 15M with near identical values to the tune on
40M. I'll check 20M in the AM.

Getting closer!

Jeffrey.

No ALC on 10m with low output usually just means re-alignment of the RF deck on that band. A rig that is out of neutralization does not necessarily have parasitics. Parasitics in the driver will be noticed if output or plate current suddenly changes when the drive tuning control is rotated. Should be a smooth 0-max out-0 transistion; any radical jumps would indicate a squirrely driver tube. New ones are worse for this than used ones. Some manuf of tubes are worse than others for a particular rig.
I would use the TUNE position of the rig for initial plate dip; this puts a lower screen voltage on the PA which helps prevent damage to them when out of resonance.
Other than these minor points, you are right on!
bill
f x <dawnlight1491@...> wrote:
HI... my 2c worth...
For all tube final rigs, here is a rule of thumb...Start with the Load control at minimum, i.e. counterclockwise... Go key down on CW on the desired band... while monitoring the plate current (Ip), rotate the Drive control for max plate current, and tune the Plate control for a minimum (dip)... now that the tubes are happy, you can increase the loading (Load control) ... after each increase of the load control, redip the plate since there is interaction... Also, keep your other eye on the power out function of your SWR meter...the peak of the power output should coincide with the dip of the plate current... if it does not, that is likely an indication that the finals need to be neutralized... (some parasitic oscillations going on in there)...

If the output on 10 meters is low there are several possibilities...
1. insufficient drive (may require retuning the internal drive coils, or a new drive tube)
2. Finals are "soft" i.e. old, or gassy...
3. Finals out of neutralization
4. Inaccuracy in the power meter reading on 10 meters..

Hope this is helpful.

316. Re: [TS-520_820_530_830] Low Power on 10M

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-03-11 01:11:52 UTC
From: f x
Topic: 311 Message: 316

Hi Bill,
After reading your comments below, I scratched what little is left of my hair and thought... hmmmm... that's not exactly how I remember things, but what the hey... lets check the flagging old memory... So, here is what I found...
Quotes from Bill Orr's Handbook, 22nd edition, page 21.18-21.22, and the ARRL handbook... Bill Orr says..."Proper neutralization is definded as the state in which: with plate and cathode (sic, grid) tank circuits resonant and with maximum cathode voltage, minimum plate current and maximum power output occur simultaneously. This implies that input and output circuits are independnent of each other with respect to common reactive currents, and thus the tuning of the circuits reveals no interactions." My own stuff... The cathode and grid and screen and plate all have inter-element capacitance... in series... this results unfortunately in positive feedback which, when the frequency gets high (i.e. 10 M or so), the feedback is enough to cause oscillation in the final stages... It is this possible oscillation which I called a parasitic earlier... The purpose of neutralization is to match the tube capacitances exactly, and 180 degrees out of phase, so that the oscillations can never occur... there are other things used as well... resistors with a few turns around them... in the plate leads... swamping (loading) resistors on the grid side... etc., etc.

I am not particularly familiar with the "squirreliness" of a 12 BY7 tube, but it would have the same input-output issues as the finals... I do still have a new one in the box... new being from about fifteen years ago... did not send it along, as there seems to be plenty of drive available on all bands in my rig (except maybe for 10M)

Don't mean this to be contentious, Bill.... but the converstaion did make me go back and look some stuff up... I was first licensed in 1957, and the first non-tube rig I owned is that -830 (though I did operate other rigs)... used to build and operate Novice Q-5ers, had a Hammarlund Super Pro once, transmitters and VFOs mostly home brew, never more than about 75 watts... 807's and the like... mostly on CW... hehe... just bought my first keyer this week... guess the bug will get retired now... so please forgive a crusty ole fogey who has time on his hands this evening... until the rig gets back and the new antennas go up...

If the neutralization is way off, yes they will oscillate on their own. But being a tetrode, and being that Kenwood designed their tank circuits extraordinarily well, and provided for a great deal of isolation from input to output, instability of the PA is not often observed here. The driver stage is another matter.
I have not stopped to count the number of tube rigs that have been through the shop, don't have time, hi hi! Gotta get on another rig :)
Someday I will share some broadcast transmitter stories.. on another group perhaps.

319. HF Mobile Install.

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-03-17 14:51:36 UTC
From: ww3o2003
Topic: 319 Message: 319

Hi guys. It was a warm weekend (finally) in Central PA so I installed an HF rig in the Chevy G-series cargo van. The antennas are two Hamsticks, one mounted on each rear top door hinge. They stand nice and straight but are only about 14 inches from the truck body. The rig is a Kenwood TS-130 with solid state finals & shut-back circuit for Hi-SWR protection. The 75 meter whip would not trim to better than 40 ohms at resonance. This reduced transmit power a bunch. I finally installed an MFJ cheapo tuner and used a field strength meter to peak the output. The results were very good. Now, the drivers side antenna location is dedicated to 75 meters and the passenger side can be 10-20 or 40 meters. There is a two-position antennas switch mounted on the steel frame of the seat to select antennas. Since the 75 meter side is only used for around 3990 KHz I've placed the tuner on the floor our of the way. Hopefully the vibration of the truck won't detune the tuner.
73,

Pete Carr WW3O
State College, PA

Mike, have a look at http://www.mods.dk/, then select "Kenwood" (in the t top navigator), then select "Manuals" (in the left navigator). There are PDFs of both the operating and the service manual.

For sale:

Power Cables for all Kenwood TS-520 Series:

AC Power Cable, two cond. with connector for TS-520 $19.00
DC Power Cable, two cond. with connector for TS-520 $19.00

Shipping is $5.00 additional for any quantity.

I also have these:

Power Cables for all Yaesu FT-101 Series:

AC Power Cable, two cond. with connector for FT-101 $19.00
DC Power Cable, two cond. with connector for FT-101 $19.00

From: kg6mwh
Topic: 328 Message: 328

Greetings to all. I'm a new member of the group. Also a newly licensed general.

I'm the proud new owner of a TS-830S, which I bought partly as a backup for my Yaesu FT-897 and partly because the TS-830S is such a classic piece of equipment.

Can anyone suggest a good repair person in the San Francisco or Silicon Valley area? The TS-830S was shelved for a while before I bought it, and I'd like to give it a good preventive maintenance treatment.

I think it may also have a problem, which I hope is minor. After releasing PTT, it takes about a second for the receive level to come up to a proper level. I also think the receive level is, well, bouncy for 30 seconds or so after PTT is released.

Any advice appreciated. I'm a newbie, so it's perfectly OK to talk down to me ;-) .

May be bad or dirty T/R relay, these are about 28 bux from Kenwood/PacCoast Parts.
On your other stuff, good cleaning and alignment will run ya 100-140 labor plus shipping. I don't know of west coast guys, here's two in mid-US:
www.avvid.com
www.amateur-repairs.com
have a good day

r&r the pll and vco sections, separate the boards, and clean the inter-board connectors. Then check the VCO adjustments on all bands.

Dear Gary,
Several questions...
1. Do people talk to you on CW?
2. What kind of antenna is the rig connected to?
3. What band or bands are you on?
4. If you use the bulb on SSB as a load, does it flicker when you speak?

Greetings, Gary...

Congratulations on the General. I too am a newbie General as of February.

Like you, I've found it surprisingly difficult to start QSO's.
However, I've had very good luck on contest weekends. The contact will
be very brief, but there'll be lots of people who want to log you, and
so contests are a good time to figure out how far you're hearing and
how far you're being heard. I found it very encouraging because I've
found that, if I can hear them, they can generally hear me.

If you'd like to schedule a QSO, please email me. My 15-meter antenna
is the most efficient, so maybe a weekend during the day?

Bill and Dave,

Thanks for the reply gentlememem, I'm using a Windom ant . 42 ft on one side 84 ft on the other with a 4:1 balun. I belive the ant is pretty flat. I think my problem is microphone. I am going to try a mike from a 520 this afternoon. Maybe by substitution I can work out the problems. Problem solving is just part of the fun. It's like code, if it was easy everybody would be doing it.
Thanks fellows ,I will keep you informed.

Make sure you are tuned for "max smoke" on CW mode, after tuning first in TUNE mode... touch up on CW with CAR control full up.
Then, make sure that you are getting ALC indication with the mic gain at 12 o'clock or less. If you have to have the mic gain higher than that, could be a mic impedance mismatch and your audio might not sound very good. Often, guys won't answer a CQ if the audio is bad.

341. 6293 Tubes

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-03-31 19:27:56 UTC
From: José Pedro Alvarez C.
Topic: 341 Message: 341

Hello Again,

While searching the net for information on my beloved TS-820S I found a couple or articles by Glen E. Zook, K9STH on the 6146 family of tubes. He writes that 6293 tubes are totally interchangeable with 6146B and are a better option, I quote:

"There is another 6146 family tube that is "superior" for operation at least through 10 meters. That is the 6293. This tube was designed for "pulse" service and is rated at 1-Kilowatt pulse power input. The primary difference between these and the "normal" 6146 is that the plate is much "heavier" in its construction. Back in the late 1950s and early 1960s we would almost "kill" to get our hands on a pair of these for our DX-100s, etc. The 6293 outlasts the 6146 in "normal" service by at least 5 times and often more than 10 times the life of the tube. These tubes "show up" at hamfests, swap meets, etc., from time-to-time. If you see some of these, definitely "glomp" onto them!"

I have seen these tubes for sale in several online shops and are priced the same or even cheaper than 6146B's.

My TS-820S's output is about 50 to 55 watts on a dummy load on all bands except for 40 meters, where the output is 85 to 90 watts (measured with the AT-230 meter) so I'm thinking about a new set of finals and a new driver. What do you think of installing these 6293 tubes instead of 6146B's? Any thoughts?

The rig has an AVR board with voltage test points. The 8.1 volt TP read about 9.5. The others read within 10% of spec. It appears, from the 50 cent schematic in the Op. manual, that the TP is controlled from two transistors and a diode with a 120 ohm resistor in series. The diode is not identified as a venear (sp). There is no adjust pot on that circuit. Would the group have a suggestion on how to proceed with the volatge fix?

Hi Peter,

It's just a matter of adjusting the capacitor for a minimum amount of RF at the antenna connector (with the SG switch off of course).

You can build a simple RF Probe such as:

http://www.qrpp-i.com/KA8MAV_RF_Probe.htm

and use a inexpensive DVM.

Ideally use a long non metallic screwdriver. I have used a regular long metal screwdriver insulated with heat shrink tubing (except the tip). If you use the later, you will have to remove the screwdriver between adjustments.

1. replace PA tubes
2. set bias in usb or lsb modes
3. tune for max smoke on 20m
4. adj neut cap for even peaks of plate current on either side of resonance, in TUNE mode. If plate current maximums are lopsided, adj neut cap so they are even
5. confirm that plate dip coincides with max rf out into dummy load
6. confirm again on 10m
REPLACING DRIVER;

1. replace driver tube
IN THE MIDDLE OF EACH BAND:
2. tune closest CAL signal in middle of each band. Peak the preselector for max signal.
3. in TUNE mode, touch up the tuning of the driver plate coils for each band for max ALC indication. You may have to back down the CAR control to keep it in scale.
The driver plate coils are the larger of the tuning coils on the RF unit, just in front of the PA section cage. Use plastic tool.
NOTE; if plate current varies radically when tuning the PRESELECTOR or DRIVE TUNE control through it's range, or acts like it has Hysteresis in the response, you may have a wild driver tube. Leave the filaments on for a day or two; or change back to the old tube or another tube. Some 12by7s don't like the Kenwood. Save them for your Yaesu buddies!
bill
Peter Weinzettl <inmotion@...> wrote:Just wondering if there's any step by step instructions available (other than in the manual) regarding tube replacement and neutralization for the TS-520S. What if I don't have a voltmeter? Any help with this would be greatly appreciated Peter VE3BHPve3bhp@...

350. TS-830S

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-04-09 07:19:33 UTC
From: Andrew Rigg
Topic: 350 Message: 350

Hi,

I am new to amateur radio having just passed my foundation licence in the UK.
I bought a TS-830 from a rally today and was told it would operate on 10W output power (My max allowed).

I have read the manual and it doesn't seem to mention any power adjustment at all???
Is this possible to operate on 10W or was the seller telling me a pack of lies??????

I have not got my aerial up yet but hope to in the next few days and need to know if I can operate this legally.

I have noticed a mod on the internet using a battery and a potentiometer connected to the ALC line to reduce power but this was for the ts-520. Will t work on the ts-830?????

Any info appreciated.

Andy

351. 520s- how much power out in "Tune" mode?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-04-10 15:05:44 UTC
From: Peter Weinzettl
Topic: 351 Message: 351

Anyone know how much power the TS-520s puts out in "Tune" mode. After I have tuned my radio for full output on a desired frequency, my MFJ 949B's wattmeter shows around 20w (when set to 30watts FWD) and 10w (when set to 300watts FWD). Obviously something is not right with the meter, just wondering which setting is more accurate. Anyone have any experience with this MFJ product, or know why the reading would indicate half on the 300W setting?

Power meters are very inaccurate down around the low end of their reading. Good rule of thumb for any insturment is choose the range that gives you the reading closest to full scale.
If your wattmeter is rated +/- ten percent full scale, that means it is plus or minus 30 watts of watt-ever (sorry) you are putting thru it.
20 watts on tune is normal.

Hi Pete. Your meter is fine. The most accurate indications will be read on the upper half of the scale. This applies to all analog meters (voltmeters, ohmeters, etc), not only wattmeters. And yes, 20 watts is about right in the tune mode. From: Bill Scurlock
Topic: 351 Message: 355

Hi Pete. Typically, metering instruments are rated for their accuracy as some percentage of Full Scale. For example, if the meter is rated at plus or minus 5% of full scale, on the 300 watt scale your reading would be plus or minus 15 watts from what the meter indicated. On the 30 watt scale your reading would be plus or minus 1.5 watts from what the meter indicated. For a 2% accuracy meter these numbers would be plus or minus 6 watts, and plus or minus 0.6 watts. So the answer to your question should be obvious - use the scale that lets your meter read as high up on the scale as possible without damaging the meter. For digital instruments there are additional criteria to consider. All of this assumes that there is nothing wrong with your meter such as changing values of resistors, etc. Good luck - Have fun. I have no experience with the 520. 73,

Bill, K5GCW

Thank's to the always-knowlegable folks on this group for all the answers to my questions. A couple of things re my MFJ wattemeter though;

1) Although I do have the original manual, I cant find the specs to the unit (MFJ 949B-circa 1980's) anywhere, so I don't know what percentage accuracy the unit is rated at.

2) I still can't answer why the unit shows the appearantly proper power out (20w in tune mode) on the 30w setting, and exactly half that in the 300w setting.

When I check power out in CW mode and key down I get a reading of around 60w in the 300w setting and of course a fully buried meter in the 30w setting.

Should I just basically double whatever reading I get in the 300w mode or are there too many other variables involved.

I guess the answer is to get a better meter. Trying to do this a cheaply as possilbe though.

1) Although I do have the original manual, I cant find the specs to the unit (MFJ 949B-circa 1980's) anywhere, so I don't know what percentage accuracy the unit is rated at.

Comment: Call MFJ and ask them.

2) I still can't answer why the unit shows the appearantly proper power out (20w in tune mode) on the 30w setting, and exactly half that in the 300w setting.

Comment: Because, at the 20W power level, the 30W meter range is much more accurate than the 300W range.

When I check power out in CW mode and key down I get a reading of around 60w in the 300w setting and of course a fully buried meter in the 30w setting.

Should I just basically double whatever reading I get in the 300w mode or are there too many other variables involved.

Comment: No. Just don't use the high meter ranges to read small power levels.

I guess the answer is to get a better meter. Trying to do this a cheaply as possilbe though.

Comment: Probably not. Unless the antenna/transmission line match is a perfectly resistive 50 ohm load at the antenna, the power meter will not indicate the correct power level anyway. Most people make measurements at the transmitter output point in their system to get an indication of SWR for antenna tuning/performance purposes. What you are most interested in are "relative" readings for tuning purposes, or to detect some change in the performance of your equipment or antenna system. Cheap is adequate for this purpose.

Have fun Pete. 73, Bill, K5GCW

Hello all Kenwood Lovers,

I have another question for the collective wisdom of the group.

I'm being offered a TS-830M (like the S model but with AM). I shouldn't really buy it but probably I will anyway. The radio comes alone without the external VFO (price is US $ 250 BTW).

Are there any chances that the VFO-820 of the my TS-820S can be made to work with the TS-830M?

Thanks for your thoughts.

I think they have the same frequency of operation, the two VFOs, but you may have to modify the switching a bit, not sure. $250 for the AM model is a great price, because they are quite rare! 73 and good luck, Bill K0ZL

Thanks Bill, great reply! The main thing is that into a dummy load, you are able to load the radio up for more than about 250 milliamps and see at least 85 watts out; otherwise, you have weak finals. They will still work but they are getting weak at less than 250 milliamps and 85 watts. 73, bill

Hi again Bill(s)

Here's my readings:
Tuning 14250 into dummy load for "full smoke" on CW.
Unsing Radio Shack 21-534 SWR/Power Meter that I borrowed -
(+- 150w @ 200w scale)
(+- 150w @ 2000w scale)

TS 520s Readings -
(250ma on IP)
(+20 on RF)
(750V on HV)

Then when switching over the the MFJ power meter-
(+-60w/ slightly over half-scale on the 300w scale)

Any comments would once again be appreciated.

363. FS: AM Filter for the TS-520

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-04-12 03:43:18 UTC
From: rsakabu
Topic: 363 Message: 363

Dear Group,
I really blew it this week. Someone offered an AM filter with instructions for the TS-520 for sale. I jumped on it figuring I can put it into one of the IF slots in my R-5000 or swap out the filter in a YK88S-1 board in my TS-450.

When I got it, the filter didn't look like a YK88-A and sure enough it wasn't. It is an FFC-332-1 which is obviously made for the IF of the TS-520 which is not the same as the 8.83 MHz of all later models. I think it is either 3 MHz or 5 MHz.

The instructions are from Henry Radio in LA and it tells you how to modify the CW mode of the TS-520 into AM mode and how to eliminate the BFO for receiving AM. If I had a TS-520, I'd probably do the mod just to see if it works <g>.

Anyway, if there is anyone on this list that is interested in doing AM on a TS-520, I'll sell this filter and instructions for $35 shipped or trade for something interesting. If not, I might just have to buy a 520 myself (after all, I'm having a great time with my TS-830)

Hi Bill. The AVR board has a test point for 8.1 volts DC which is reading 9.3 volts. The other two TPs are fine. There is no pot adjust for this voltage so I figure that the Zener diode must be bad. The Ops manual says that it's a diode but nothing else. Since the trouble is high volts, not low, I guess that the two transistors with the diode are okay. The schematic for that board is really crappy so I enlarged it on a copier. That didn't help much. The board is at the top rear of the chassis and easy to access and nothing looks burnt or smells. It might be aged resistors but I have no other ideas.
Any wisedom?????

It's a shunt regulator, which uses Q9 to parallel the 5 watt resistor to get the 8.1 volts. The zener should read about 4 volts as that is it's rating (they use a voltage "divider" actually a multiplier) to get to 8.1 volts. If Q9 is not shorted, and the resistor is not getting real hot, and the zener reads 4 volts or thereabouts, there is nothing to fix unless the rig is messing up somehow. the zener is WZ-040 and Q9 is 2SA671. If you need sub info let me know, paste copy of this to the new email if you would. thanks bill

366. FILTER CAPS PLATE V

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-04-12 23:03:06 UTC
From: Bill Leahy
Topic: 366 Message: 366

filter caps for hi-v on these transceivers:

P7453-ND CAPACITOR, ELECTROLYTIC,

from digikey, 150uF, 500V, about the right size. We'll see when they get in how they work out and I will let y'all know

367. Re:Re:Re:Re: [TS-520_820_530_830] OT: TS-180 voltage problem.

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-04-13 12:41:43 UTC
From: pscarr@juno.com
Topic: 344 Message: 367

Hi Bill and thanks for the great info. I'd checked for "hot" stuff on the AVR board. The 4 volts on the zener will be easy to check. As you know, none of that info is listed on the schematic. That's why the guys on this list are so great. They have all that stuff!

Thanks again and have a great Sunday.

369. Swapping Driver Tube

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-04-13 19:37:36 UTC
From: overthepole
Topic: 369 Message: 369

Hey Bill,

When we last discussed swapping tubes in my 820 you had mentioned the need to realign the RF deck afterwards. If I only replace the driver tube is realignment needed? Could you speak to the relationship between the driver and finals a bit?

I'm thinking that my driver tube is weak because when I first key up my voice peaks are on the order of 75 to 100 Watts. As I talk they lessen to 50 to 60 then to 30 to 50 and then to maybe 25 if I get real long winded. Am I on the right track here or is there another component that might be suspect?

Thanks as always for the infinite wisdom!

Jeffrey.

371. Old Iron... Great Iron... and testimonial

Dear Group... Just felt I should share a little of my recent experiences with my TS-830... Since it had been in long term unheated storage (8 years), I was worried when I flipped the switch the first time... but it fired right up and I worked the CW and Phone contests in March... using an extended double zepp for 20 meters fed with open wire line and a tuner at about 25 feet up... worked all bands, including 160... had about 80-90 watts out most places... worked about 120 countries each event. Decided after reading this board to send it to Bill for a tweaking up... during the process, he suggested the QRO mod and a new driver tube... I said sure... During its absence, I put up a few new antennas... vertical ground planes on tin roof structures (carport and pole barn) for 10 and 15, and bobtail curtains on 20 and 40... could hardly wait for the return... the turnaround was quick, even with a blizzard in CO... The results... all I can say is WOW... between the new power out...(my meter says 175 to about 150 watts out according to band) I can now be HEARD... (this is with the OLD, original 6146 Bs)... if I figure the dBs, I got about 3 dB from the QRO mod, and about 5 from the bobtails, totalling 8 dB so I am at least one plus S unit stronger than before... and the low takeoff angles are great... can work DX with ease, often answered on the first call even in moderate pileups... have even had them call ME for a change.... now to get some POWER.. and another 10 dB... hehe. The receiver was always good, and is now better since realignment and work on the filter configuration (too tight if you can believe it)... only problem is overload when the NB is in use... creates lots of "bogies"... so generally do not use it even though sitting under a 43 KV line.... so, here she sits, purring away... for Lord knows how many more years... Think it was the best $375 I ever spent on a rig... and thanks to Bill for all the help... 73 and maybe see you on the air sometime... NYOY Raleigh

Topic: 371 Message: 373

Hi Jim, It is an increase in the screen voltage to the finals so that you can run higher plate current... I can typically run 325-350 ma of plate current at 750 volts... 244 watts input... at an efficiency of 65%, +/-, that yields 158 watts out... all meter readings I have available check... the remaing power, 85 watts, is dissipated in the plates as heat... but the tubes are rated at 90 watts each, 180 total... so, if the power transformer and diodes can stand the gaff... no problem... am just a little more careful to use the tune mode into my dummy load when changing bands and making sure that the SWR stays down below 2:1(20 watts more to dissipate) after the initial tuning, I now tune up using the power out meter on my tuner. As Bill says, I tune for maximum smoke, and let it run.. I think there is also a kit from International Radio for the same mod.. http://www.qth.com/inrad/ Kenwood TS-520/530/820/830 QRO Kit
Fits inside radio. Increases power output 25% or more (with good 6146 tubes). Kit does not include tubes. Price reduced to just $15.00!
See our Secure Order Form to order. In my case, the driver tube was shot and associated circuitry was misaligned, so I saw more than the 25% advertised.. 73, RaleighNY0Y

If you change the DRIVER TUBE you need to re-align the RF deck, all three coils per band. If you change just the FINALS you only need to touch up the drive plate coils, the larger ones toward the PA cage. To check the driver tube, tune in TUNE mode into dummy load, with carrier up high enough to get a ALC reading on the meter. Unkey, let tubes cool off a minute, then re-key in TUNE mode and observe the ALC reading. If it drops off more than about 10 percent, you have a weak driver. If it doesn't you may have weak finals. bill

Hi Raleigh, I believe plate dissipation on the 6146B is 30 watts, not 90, am I right? At any rate, going over the plate dissipation for short periods won't hurt them, if we are only going to 42 watts each for a few seconds they will be fine at the higher levels. As Inrad suggests, start out with new tubes or you won't see the benefits. With your rig, we went only from 85 watts to 120 I think with the old tubes, but up to 150-160 or more with the new ones. Also, I don't think the Inrad mod uses the SG switch to select between stock screen voltage and boosted screen voltage! That is a 'ZL original I think... at least, I thought it was when I figured it out. The SG switch is useless anyway unless you are running a transverter. bill

Wow thanks Raleigh! <blush> When you get your amp, you may want to run low power into it... 3-500z wants no more than 60w drive, and two of them will want no more than 120 watts. If you keep drive below that level, you won't need to use the bogus ALC line from the amp back to the rig to control drive. bill

The QRO mod in it's basic form raises the screen voltage on the finals from 220 volts to about 300 or so, using the internal supply in the rig. In the form in Raleigh's radio, I used the SG switch and screen voltage control relay to switch the screen voltage to give him the option of "stock" or "boosted" screen V. Before anyone starts protesting about pushing the tubes too hard, yes we are doing that by about 10-15 percent on the plate dissipation; but the precedent for this is the Collins KWM2 rig, where I got the inspiration to try it the first time; they run 300-310 volts on the PA screens, or something close to that. Slight modification of your tune-up procedure is all that's needed to ensure long tube life at the increased dissipation (darn, am I speeling that right???) levels. i.e., don't take so long to find resonance! b bill

Subject: Re: [TS-520_820_530_830] Swapping Driver Tube

If you change the DRIVER TUBE you need to re-align the RF deck, all three coils per band.

If you change just the FINALS you only need to touch up the drive plate coils, the larger ones toward the PA cage.

To check the driver tube, tune in TUNE mode into dummy load, with carrier up high enough to get a ALC reading on the meter. Unkey, let tubes cool off a minute, then re-key in TUNE mode and observe the ALC reading. If it drops off more than about 10 percent, you have a weak driver. If it doesn't you may have weak finals.

bill

overthepole <overthepole@...> wrote:
Hey Bill,

When we last discussed swapping tubes in my 820 you had
mentioned the need to realign the RF deck afterwards. If I only
replace the driver tube is realignment needed? Could you speak
to the relationship between the driver and finals a bit?

I'm thinking that my driver tube is weak because when I first key
up my voice peaks are on the order of 75 to 100 Watts. As I talk
they lessen to 50 to 60 then to 30 to 50 and then to maybe 25 if I
get real long winded. Am I on the right track here or is there
another component that might be suspect?

Thanks as always for the infinite wisdom!

Jeffrey.

Group members:

Recently a couple of posts with attachments have gone out to our group from a member with an email address of inmotion@.... He is a valid group member that may have been infected with a trojan horse program, as the last two posts consisted of meaningless subject lines and an attachment. One was an .SCR script file and the other was a .PIF file.

DO NOT open these attachments under ANY circumstances, as they may be a worm or trojan horse file.

I have disabled this member's account until we can get it straightened out. I have also deleted the messages from the archives so that they will not be opened inadvertantly by someone else.

I have also disabled attachments to the group; this is a long-standing policy of mine to prevent just such an occurance; how the attachment feature got turned on, I don't know as I am the only one that can do it.

Please accept my apologies for any problems this has caused. Normally, Yahoo allows you to scan such attachments prior to opening them; this was not the case, this time.

Again, if you see anything from this group in your Inbox with an attachment, please DELETE IT WITHOUT OPENING THE ATTACHMENT.

thanks,

Bill K0ZL
Group Moderator

Hi AWC, Well, you can find me on the bottom 50 kHz of 40 almost every night after 0200 GMT or 20 if it is open... weekends, mostly CW, but occasionaly forays into the fone bands if sigs good... am DX chaser mostly, and work most contests just for fun... never send in a log.. What is your call AWC? Will listen for you... regards and 73 NY0YRaleigh Stelle

awc <awc@...> wrote:Nice tune up.what frequ's do you hang on FX? just might give to call from up here in the north.73'sawc----- Original Message ----- From: f x To: TS-520_820_530_830@yahoogroups.com Sent: Sunday, April 13, 2003 6:25 PMSubject: [TS-520_820_530_830] Old Iron... Great Iron... and testimonial
Dear Group... Just felt I should share a little of my recent experiences with my TS-830... Since it had been in long term unheated storage (8 years), I was worried when I flipped the switch the first time... but it fired right up and I worked the CW and Phone contests in March... using an extended double zepp for 20 meters fed with open wire line and a tuner at about 25 feet up... worked all bands, including 160... had about 80-90 watts out most places... worked about 120 countries each event. Decided after reading this board to send it to Bill for a tweaking up... during the process, he suggested the QRO mod and a new driver tube... I said sure... During its absence, I put up a few new antennas... vertical ground planes on tin roof structures (carport and pole barn) for 10 and 15, and bobtail curtains on 20 and 40... could hardly wait for the return... the turnaround was quick, even with a blizzard in CO... The results... all I can say is WOW... between the new power out...(my meter says 175 to about 150 watts out according to band) I can now be HEARD... (this is with the OLD, original 6146 Bs)... if I figure the dBs, I got about 3 dB from the QRO mod, and about 5 from the bobtails, totalling 8 dB so I am at least one plus S unit stronger than before... and the low takeoff angles are great... can work DX with ease, often answered on the first call even in moderate pileups... have even had them call ME for a change.... now to get some POWER.. and another 10 dB... hehe. The receiver was always good, and is now better since realignment and work on the filter configuration (too tight if you can believe it)... only problem is overload when the NB is in use... creates lots of "bogies"... so generally do not use it even though sitting under a 43 KV line.... so, here she sits, purring away... for Lord knows how many more years... Think it was the best $375 I ever spent on a rig... and thanks to Bill for all the help... 73 and maybe see you on the air sometime... NYOY Raleigh

388. Re: [TS-520_820_530_830] TS-520SE VFO CLEANING INSTRUCTIONS.

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-04-15 14:09:10 UTC
From: Bill
Topic: 382 Message: 388

Hi RayYou have to remove the vfo assembly and clean the sliding contact on the rear of the vfo tuning cap. remove your knob on the front, and the plate with four phillips screws in front. remove the four screws internally that are mounting the VFO to the chassis. Unplug the vfo power (2 pin) and output (rca coax). Carefully wiggle the VFO out from behind the front panel. Remove the cover of the VFO, careful to preserve the spacer washers on the rear stud. Use CAILUBE controls cleaner only, and spray a little on the VFO contact. Plug VFO in again, power up rig (no filaments), turn on the CAL and listen to the markers as you tune from one end of the vfo travel to the other using the stub shaft that the big knob goes on. Turn it back and forth until all markers come in clearly with no "grunge" or jumpiness. While you have the VFO open, resolder the flying leads inside, that go to the tuning coil and the tuning cap. This will "relax" any tension that are on these joints and will reduce temperature drift. Put everything back together and enjoy ten more years together. bill K0ZL

rayfennessey <ray@...> wrote:Hi,

The VFO on my TS-520SE is almost impossible to tune between 350 and
500khz. This happened once before and, with heavy use, corrected
itself leading me to believe it was dirty. Has anyone else
experienced this problem and, if so, how did you resolve it.

Many Thanks,

Hello fellow members!

I have exciting news for our group.

Gary, KC0NPJ, has volunteered to become a co-moderator, sharing my duties in administering this fine group.

His duties will include monitoring group activity for compliance with Yahoo's terms 'o' service and group policies; approval of new members and moderation of messages as needed; and other administrative duties that I can dump on him. Er, I mean, "delegate"... hi hi!

Please join me in congratulating Gary on his appointment and give him your support.

Thanks, and 73!

OK Gary. Not to worry, you don't have to do anything just yet until we go through the whole moderating thing with you. I am going to have to write up a "moderator's guide" since nothing like that seems to exist.. I am sure our exchanges will help that happen! You will receive notices of members applying and leaving, and files uploaded to the group. I get the same thing, so for now just delete them. If you have a minute, log in to the group and navigate around the different areas, I am sure they will look a bit different now that you are a moderator! Don't worry, you can't break anything... have fun. We will talk about membership rights in a day or two. 73! and thanks SO MUCH for volunteering. Bill

From: jeffwreg
Topic: 402 Message: 402

I have a Kenwood SM-220 Station Monitor with BS-5 PAN display for sale.

This unit is in very good condition, recently calibrated, with very bright CRT display and low usage on the unit. Unit was originally used with the Kenwood TS-520S transceiver.

The SM220 Station Monitor has the BS-5 PAN Display (3.395 Mhz IF output), which is used for the TS-520, TS-900, R-599, TS-511, and TS-510 series of Kenwood transceivers.

Also included are copies of the Owner's Manual and the Service Maintenance Manual.

The SM220 Station Monitor is comprised of a monitor-scope, oscilloscope, and two-tone generator. The BS-5 PAN Display allows you to view the 'spectrum' around the frequency being worked.

Asking price is $365 plus shipping costs to your location.

I will guarantee this unit not to be a 'DOA' upon arrival!

Please contact me at:

n5itu@...

I have a TS-520se and I was wondering if I could connect a freq
counter directly to the Car out Jack and get a frequency readout that
the radio is tuned to such as using a DG-5 Digital display, or does
the DG-5 perform additional magic to obtain a correct display.
Thanks
Bob

Typically a digital readout needs 3 inputs: vfo, band osc, and het or car oscillator: it then does the math to find what freq you are on. bill K0ZL

405. DC Power Operation Question

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-05-01 06:33:09 UTC
From: pclisbee
Topic: 405 Message: 405

I just installed a TS520-S DS-1 DC/DC converter on my Kenwood.
When running on the battery, I am not able to tune to full power output (50 watts only instead of 100 watts) and there is a small hum in the speaker when the filaments are on. The battery output at the battery is 12.9 VDC, and 12.8 VDC at the tranceiver.
Is this normal not to be able to tune to full power when using the DS-1 when working on battery power?

Yep. Check your high voltage (be careful! use clips leads then turn on the rig, no filaments). On 120vac, you should see 800-900 volts. On DC at 12.9v you will see somewhat less. This will affect your power output somewhat. You didn't mention if you measured your voltage at the transceiver in RX or TX mode, it will make a difference. 73,Bill

Not sure, but you battery output is low. Should be 13.8 VDC at normal charge.
The alternator on your car should put out about 14.6 volts when the car runs.

On tube rigs, the input voltage on 12v is much more critical than SS rigs. a couple of volts will make diff between 50 and 100 watts, whereas with a SS rig it would be diff between 80 and 100 watts due to the action of the ALC circuit. Also your screen voltage goes up and down on the tube rigs, further reducing output. If they had a regulated screen supply that would not be such a factor. Be happy with 50 watts, at any rate... it's 1/2 of an "S" unit less. bill

Greetings everyone! I just picked up a TS-520S (my first HF rig), and I'm loving it!
I have a basic question: for calibrating to the 25kHz marker tones, the manual directs me to zero-beat one of them...but what am I zero-beating to? Do I need to transmit? For calibrating to WWV, it says to use the tune function, which does seem to produce a tone. But for calibrating the dial, it just says to use either USB or LSB and zero-beat it.
I'm probably not making myself clear, so I'll get the manual out tonight and tell you which switches are supposed to be set to what.
Thanks for any help!

"Zero-beating" on the modern SSB rigs is difficult, because of the action of the filters, you can't really HEAR zero beat! So it's kinda by-guess-and-by-golly, that sounds about right. In the 520 in the TUNE mode, the carrier oscillator is offset so that you can hear 'zero beat', but just barely. Turn on your calibrator and carefully tune the VFO until the beat tone at one of the markers decreases to a very low bass tone, then slowly keep tuning until you hear the tone get REAL low, then it stops... or wavers the audio very slowly. That is close enough. That's what zero beat sounds like without the filter in the way. Now, switch to USB or LSB and do the same thing. Note that below a certain tone, you really can't hear it but you can FEEL it... hard to explain, but you will be able to sense zero beat if you listen very carefully. Use a big speaker too, that helps. Then look at the hash marks on the VFO index... One in the center, one to the left and one to the right, I think... If there are three, carefully rotate the dial skirt so that the proper 25kHz dial marking lines up with the mark for the mode you are in USB OR LSB. If there is just one mark, as on the Yaesus, line it up with the one in the center. Short of trying to make a sked or traffic net, there's really no point in trying to split hairs... you can get to within 100-300 hz of a desired frequency even without a digital readout, using this method; but you ain't gonna win any frequency measuring contests. I like being right on, but sometimes I take it to a rediculous extreme. I don't know why. 73 bill

More info:

The manual says to calibrate, set:
Function to CAL-25
RIT to OFF
Turn main tuning knob to receive a marker signal
For LSB: Mode to LSB
Zero-beat a marker signal.

Zero-beat it to what?

Andy

Why, against the marker signal, of course! There should be a continuous carrier every 25 khz on the dial with the mode switch at CAL. 73 bill

cplt102 <kd6mdo@...> wrote:More info:

The manual says to calibrate, set:
Function to CAL-25
RIT to OFF
Turn main tuning knob to receive a marker signal
For LSB: Mode to LSB
Zero-beat a marker signal.

Zero-beat it to what?

Andy

--- In TS-520_820_530_830@yahoogroups.com, Bill <coorsbill@y...> wrote:
> "Zero-beating" on the modern SSB rigs is difficult, because of the action of the filters, you can't really HEAR zero beat! So it's kinda by-guess-and-by-golly, that sounds about right. In the 520 in the TUNE mode, the carrier oscillator is offset so that you can hear 'zero beat', but just barely. Turn on your calibrator and carefully tune the VFO until the beat tone at one of the markers decreases to a very low bass tone, then slowly keep tuning until you hear the tone get REAL low, then it stops... or wavers the audio very slowly. That is close enough. That's what zero beat sounds like without the filter in the way. Now, switch to USB or LSB and do the same thing. Note that below a certain tone, you really can't hear it but you can FEEL it... hard to explain, but you will be able to sense zero beat if you listen very carefully. Use a big speaker too, that helps. Then look at the hash marks on the VFO index... One in the center, one to the left and one to the right, I think... If there are three, carefully rotate the dial skirt so that the proper 25kHz dial marking lines up with the mark for the mode you are in USB OR LSB. If there is just one mark, as on the Yaesus, line it up with the one in the center. Short of trying to make a sked or traffic net, there's really no point in trying to split hairs... you can get to within 100-300 hz of a desired frequency even without a digital readout, using this method; but you ain't gonna win any frequency measuring contests. I like being right on, but sometimes I take it to a rediculous extreme. I don't know why. 73 bill

Thanks Bill,
I work for a small GE plant that is being run into the
ground so they can close it and do all the work in
Mexico (we make light bulb filiments). We have obsolete
plc's,machines controled by 8088 pc's {I kid you not}
and other goodies like that.
As to the rig, I've cleaned the relays, unpluged and repluged
the connectors, etc. I suspect a bad solder joint as the problem
seems dependent on temp. and it's so intermittant (gone away
at the moment) that I have been waiting for the problem to get
worse.
In case anyone on the group has had something like this
it only happens on startup for anywhere from a few seconds to
2 minutes, the rec. is dead with the s meter up near full scale
and the freq. readout is off by 2 khz. This all clears up together
and rig works like a new one after that. Just annoying actually.

Take a look at the regulators, and the rect. unit for solder joints... you will have to remove the boards to inspect, not necessary to unsolder wires, just be careful about not pinching them when you put them back. I think the regulator is on the AF unit on the 520/530, no?bill

423. Aquired 830S appears dead on TX

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-05-06 06:08:11 UTC
From: filmhog
Topic: 423 Message: 423

Hello to the group.
Just aquired a cosmetically prestine 830S Gold label. While following the instructions on tuning up, It appears to have no tx. Adjusted bias to 60ma. HV is good per meter (900v)approx. When I go to tune position and meter on ALC to peak drive on meter, there is no indication of transmit. I hear the relay pull up but no meter deflection. While trying SSB, still no meter deflection even to try to dip plate. Switch on back is set to on.....(for neutralizing position). I am new to these but do own Collins KWM's so I am a little puzzled where to start. Finals completely blown out? Possibly the driver tube. Don't want to do anything without experienced advice. All tested into a dummy load through bird 43.
Thanks for any help.
Jan

424. Update on no tx 830

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-05-06 14:51:53 UTC
From: filmhog
Topic: 424 Message: 424

Here is an update of 830s with no tx. I just examined the finals and driver tube. Finals Glow! Driver does not..... I'm going to try and find a tester today and test the drive tube. It is unlit, so very suspect obviously.
Will post results.
Jan

Power supplies, AF unit and PA section are very similar. The 530 gives you WARC bands, a better IF unit, PLL synth on the band select oscillator, slightly better VFO construction, couple other features that slip my mind. Smaller box too. Digital readout, was that standard on the 530? Not sure on the 530/s differences; someone else care to comment? bill

Power supplies, AF unit and PA section are very similar. The 530 gives you WARC bands, a better IF unit, PLL synth on the band select oscillator, slightly better VFO construction, couple other features that slip my mind. Smaller box too. Digital readout, was that standard on the 530? Not sure on the 530/s differences; someone else care to comment? bill

botr8 <b888@...> wrote:Ok thanks Bill will check that out, by the way

Hello Jan,
Two things to first check. Is the no TX on one or more bands and OK on others or is it on ALL bands?
If it is off on a few bands, it is probably the crimp connectors on the band switch wafers. Either they are oxidized or have lost their "spring". First, look at the switching action on the band switch on each wafer as you switch to the "bad" bands. If you don't see the connector physically rise as the tab switches to the connector, gently press the connector back down. Use an insulated thin, long flat screwdriver for this and be sure the rig is unplugged and the tubes have discharged, there is over 300V between the center bandswitch shaft and the rails of the bandswitch bracket.
If you see mechanical action on all connectors as the bandswitch moves to the bad bands, you need to dab a little De-Oxit with a Q-tip on the contact and move the switch back and forth to clean the effects of electrolysis on the contact.

If you have no TX on most or all bands, unplug the rig, let the tubes discharge for a good while and open up the finals compartment. Check the coupling on the bandswitch inside the compartment. It may be cracked and if you move the bandswitch, you'll probably see that the part inside the compartment is not moving in sync with the rest of the bandswitch shaft. Replace the coupling with a new one from East Coast Transistor, Pacific Coast Parts, or make one yourself with a piece of Aluminum tubing with some tapped screw holes. Be sure to use Lock Tite to hold the screws in place because Kenwood neglected to do so originally and overtightening them caused the cracks in the first place.

If those don't work, write back. The 830 is a great rig and a lot of fun to use.

You got it! Plate voltage (loaded) times plate current. To figure input on SSB, add about 15 percent to the max CW mode measurement (to account for lack of power supply "sag" in SSB). Your plate efficiency is your output power divided by your input power, times 100 percent. Should range from 60-75 percent. Allow for tolerance of your wattmeter, plus/minus ten percent. bill

The digital readout and WARC bands I remember were the big selling points for the 530/830 series, and more reliable PLL/VCO/Counter than the 820. b

432. 830S no Xmit on 40 and 15m

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-05-07 13:38:51 UTC
From: filmhog
Topic: 432 Message: 432

Hello to the group. Well the testing of my newly aquired 830s Gold proved that the driver tube needed replacing. I now have full expected power output on all bands....except 40m and 15m. These appear to have no output.
I did not touch anything yet regarding pots when the new driver was installed.
Can anyone in the group offer a suggestion where to start next in trouble shooting this problem? 40 and 15 are related by a harmonic (from my dipole experience) and I wonder if this is the reason both of those bands are down at the same time.
For those that are interested, I found a NOS driver in box at a electronics junk store for $1. Output is 100+ on 160 and 80m. zero on 40m and 15m. 100 watts on the rest of the bands with about 800 on 10m.
Thanks for any input on this issue on 40 and 15m.
Jan

433. NO power when using "tune" setting

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-05-09 23:20:46 UTC
From: Greg
Topic: 433 Message: 433

Glad to meet the group. I have a TS820s which cannot be tuned using the "tune" setting do to no power output. I realized this is usually a low power setting for tune-up proceedure only, but I must use the CW setting to get enough power for tune-up.

The tune setting DOES work for "peeking" the DRIVE setting, before tune-up , by placing the metrer switch in the ALC position.... I can then maxumize the meter reading here, by adjusting the DRIVE, but thats all. When I continue to try to tune up by placing the meter switch to RF or IP, neither setting produces any meter movement, regardless of the PLATE or LOAD settings. (Nor is there any output on an external watt meter..and I mean NOTHING!) So, I have to switch to CW, keep the CAR turned up just enough for a meter reading, and tune that way. I understand this is NOT normal, and I should be getting sufficient drive in the TUNE position, to allow for a low power tune-up.

Any suggestions on where to look for the problem would be appreciated. The switches have been cleaned etc.

73 Greg

Bill,
Wanted to let you know I did check the p.s. board for solder
joint problems and found nothing.
I did take a closer look at the problem and a better
discription follows:

turning the rig on cold the s meter is peged but sigs
are heard, after 70 seconds the unit freq readout
jumps down in freq. 3.7khz {on 40m upper ssb} and s meter acts
normaly.
Shut the rig off for 30 sec. and back on and it works
perfectly. Rig has to be left off for 10/20 mins for
problem to return on startup.
Sounds like a cap. now doesn't it?

Anyway, thanks for the help and I think since I have to spend
so much time letting the problem come back and this is my
main rig I will live with it till it gets worse hi hi
Thanks again and will be reading the mail
73
Gary

435. Re: [TS-520_820_530_830] NO power when using "tune" setting

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-05-10 03:30:08 UTC
From: Bill
Topic: 433 Message: 435

Is your idle plate current OK? Other problem may be the screen voltage, in the TUNE mode it reduces your screen voltage on the finals.. maybe due to open resistor it is reducing it too much. b

Greg <va3vfo@...> wrote:Glad to meet the group. I have a TS820s which cannot be tuned using the "tune" setting do to no power output. I realized this is usually a low power setting for tune-up proceedure only, but I must use the CW setting to get enough power for tune-up.

The tune setting DOES work for "peeking" the DRIVE setting, before tune-up , by placing the metrer switch in the ALC position.... I can then maxumize the meter reading here, by adjusting the DRIVE, but thats all. When I continue to try to tune up by placing the meter switch to RF or IP, neither setting produces any meter movement, regardless of the PLATE or LOAD settings. (Nor is there any output on an external watt meter..and I mean NOTHING!) So, I have to switch to CW, keep the CAR turned up just enough for a meter reading, and tune that way. I understand this is NOT normal, and I should be getting sufficient drive in the TUNE position, to allow for a low power tune-up.

Any suggestions on where to look for the problem would be appreciated. The switches have been cleaned etc.

436. Re: [TS-520_820_530_830] Re: hello from new guy:530s problem on startup

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-05-10 03:32:49 UTC
From: Bill
Topic: 412 Message: 436

Hi Gary,Well yes it could be a cap, but I would start by measuring my regulated voltages in the rig over time. Start with the five volts on the counter. b

botr8 <b888@...> wrote:
Bill,
Wanted to let you know I did check the p.s. board for solder
joint problems and found nothing.
I did take a closer look at the problem and a better

437. Re: NO power when using "tune" setting

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-05-10 11:34:34 UTC
From: Greg
Topic: 433 Message: 437

TNX for your input Bill it is appreciated. Yes the Idle Plate current is OK and at the recommended setting.

I will check the rig schematic for a reistior in the screen/TUNE swtich line. OK on the screen voltage possibley being too low on the finals.

My first thought was a driver tube related problem, as I thouht it was that tube which is used "mostly" durring use of the TUNE position. Also,for more info; after the rig is tuned up, power is close to 100W output, so the problem is only durring the TUNE switch use.

73 Greg

Is your idle plate current OK? Other problem may be the screen voltage, in the TUNE mode it reduces your screen voltage on the finals.. maybe due to open resistor it is reducing it too much. b

If you are getting ALC voltage, that indicates grid overdrive so it should not be a driver tube problem. also.. if the ALC stays up during transmit, and doesn't die off, the 12BY7 is OK. Just a quick way of checking your driver! Best tube tester is the rig itself... Screen voltage should be 225 plus in regular TX, about 105-165 in TUNE mode and -60 to -100 volts with the SG switch on the back panel OFF. bill

Hi All,
is it woth buying a single 6146b at the right price ? or is it
essential to buy them as matched pairs. I have a spare set of 6146's and a
driver but one has come up for sale as a single item.

cheers

Try to match manuf, and only buy 6146B's... yes it's worth it, if you have to get 5 to get two matched pairs, if price is right you will be doing good.

Hi Bill,
This might help to educate some of us raised in the "post tube" era.
Do you want a matched pair because the filaments of the 6146B's are
hooked up in series and depend on equal current draw/voltage drop
across their filaments?

If that is the case, then wouldn't it be a good idea to get 6883B's
when replacing the 6146B's? The idea behind this is that you would
rewire the 12V filament circuitry to heat the 6883B's in parallel
rather than the 6146's in series. This way, the next time you get
replacement finals, you won't have to "match" them. Of course the
current draw of mismatched tubes will still cause imbalanced power
power output between the tubes, but it might not be as bad as if they
were wired in series.

If that's not the case, then what characteristic of the tube is being
matched? Are there instructions somewhere where we can learn about
testing tubes without a tube tester?

Thanks,
Roy

Some good questions, Roy.

The only issue I have with using 6883's is that it modifies the rig. Not a problem, really, unless a potential buyer would have a problem with that or if the tubes were to become less plentiful than the 6146's.

I think the filament draw on the 6146Bs are the same from manuf to manuf, but my concern is that different manufacturers are more likely to have different inter-electrode capacitances, which will affect neutralization. I have mixed and matched different tube manufs' (same tube type however) with good results, but you never know; be prepared to back up one step if things don't work out.

I suspect as tube prices go higher, guys are going to worry less about matched pairs and all that! Just being able to get the tubes will be sufficient for most.

As for testing them, here's my method:

SSB mode. TX into dummy load. Idle current should be 50-60 mills. Raise idle current with the bias control momentarily to 150-200 mills. Unkey very quickly and let tubes cool for ten seconds. Key up again, watch plate current. If it stays up there for 2-3 seconds, unkey. You have good final or finals. Reset bias to normal.

Next, tune up into dummy load for max smoke. Unkey, let it cool ten seconds, then switch meter to ALC. Key up again in CW mode. Watch ALC meter. If it comes up and then dives back to the left, you have a bad DRIVER tube. If it stays up, driver is good.

Now load up for max smoke. You should see at least 220mA of plate current and 80-125 watts of output on 20M. If less plate current and power at absolute max, one or both finals are shot. Replace both.

That's it. Not a tube tester in sight, eh? hehe

Thanks Bill, that really helps. I've heard that matched tubes are more easily neutralized and *may* lead to fewer parasitics, but I didn't know why.

The reason I asked about testing without a tube tester was if you ran across some tubes real cheap, rather than finding a tube tester, is there a way of testing them before you put them in your rig. And if you had a pile of tubes, is there a way of matching them.

Roy you could match them, I think by either measuring the interelectrode capacitances or static DC current at a given grid bias, I don't know...

If I have several tubes to try out, I will "split" the cathode circuit in a 520 or whatever is on the bench so that the cathodes each go to ground through their own resistor; then put the tubes in, run the bias up to around 50 mA per tube, and measure the cathode voltages.. they usually come out pretty close. If one is 50 mils and another is 12, those are NOT good matches! hi.

As for the AC characteristics, I think the best thing would be to have an old Heathkit one-lunger 6146 rig set up on 10 or 20 meters with a crystal; put each tube in and see what smoke will come out the other end. Key I guess would be to keep from drawing any grid current so you aren't saturating the tube.

In fact I have a DX60 here that I am setting up for just that purpose! I just need a rock for it.

As for matched sets of tubes: my very controversial opinion is that, in a parallel configuration, tubes tend to match themselves as far as plate conductance goes... the tube that is stronger will do more work until it wears down a bit, eventually they are both pulling nearly the same load.

Many times I have replaced only the 6146 that was bad in a customer's set to save them money, if I think the other one is OK... and so far, everyone has been happy, saving from $30-50 on repairs... no warranty returns anyway!

hi hi

OK, I have been the proud owner of an 820S for about two hours. My previous rig is a CW only Heathkit HW-16 that came with three bands and a minimum number of controls so I have a lot of new things to play with! I have been through the owner's manual and it all seems pretty straightforward except for two things:

1. For base station operating, do I want the heater switch turned on or off? The manual suggest they should be off in mobile and portable operation, but it doesn't really say under what conditions it should be switched on.

2. I have found the CAL position on the 7-position VFO switch and I understand it is supposed to generate markers every 25 kHz. The book also says that when the digital display disagrees with the analog tuner, I should believe the digital frequency adjust the dial calibration ring until the analog reading matches. So, what happens when you hear the marker when the digital display does not read a multiple of 25K and all the other controls are dead center?

Tnx & 73,
Jim

Topic: 453 Message: 454

Turn on the heater switch if you are going to be transmitting. Otherwise, you can leave it off and save a few watts.

You will not hear the marker if you are reading exactly on the marker frequency, as you will be zero-beat to the marker. For instance, if the freq readout is right on 28.400, you should not hear the marker. You will hear it at 28.401 (or is it 28.399? I forget), and you will hear a 1kHz tone, since you are "off" the frequency by 1 kilohertz.

If the counter or the rig or the calibrator are off frequency, that error will show up as a difference from this.

bill

Topic: 456 Message: 456

While trying to get my new acquisition on the air, I am having a bit of a problem following the tuning procedure. I have had a tube rig before, so much of this is old hat.

Following the instructions in the manual:

1. Switch on SSB mode and adjust bias to 60ma. Check!
2. Switch to tune mode and adjust for maximum drive. Check!
3. Find the dip the plate current. Check!
4. Switch to CW mode, set meter to RF, and fiddle with load and plate to maximize output. Trouble in paradise.

In fact, the RF meter reads zero. I know about the RF volt adjustment in the back, but it does not seems to make any difference. I am tuning on 40 meters into a resonant dipole that I have used for a year or so with another rig so I am pretty sure this is not caused by a high SWR. No matter what, I get zero on RF output.

Time for new finals?

HI, This is certaily not from Bill, the resident guru, but what does the Ip (Plate Current) read when you key down in CW mode? and what is the HV reading? Could be as simple as a fried diode in the Power Out meter circuit... Since you had a dip in tune, it suggests that the finals are working... and you had a peak on the drive control... Do you have a separate output meter? Perhaps in an antenna tuner or VSWR meter? You might check what they say as well....

OK, Bill... what has been left out???

regards

Raleigh

Jim <k1zc@...> wrote:
While trying to get my new acquisition on the air, I am having a bit of a problem following the tuning procedure. I have had a tube rig before, so much of this is old hat.

Following the instructions in the manual:

1. Switch on SSB mode and adjust bias to 60ma. Check!
2. Switch to tune mode and adjust for maximum drive. Check!
3. Find the dip the plate current. Check!
4. Switch to CW mode, set meter to RF, and fiddle with load and plate to maximize output. Trouble in paradise.

In fact, the RF meter reads zero. I know about the RF volt adjustment in the back, but it does not seems to make any difference. I am tuning on 40 meters into a resonant dipole that I have used for a year or so with another rig so I am pretty sure this is not caused by a high SWR. No matter what, I get zero on RF output.

Time for new finals?

Raleigh, you covered it all! Thanks... Jim, Raleigh is right on... keep us posted after you check with an external wattmeter.

I had a similar problem on my TS 520S last week

Things to check first include

1. a dirty band switch
2. dry joint on the crystal controling 40m
3. the radio may need to be tweaked a bit
4. a dead crystal.

In my case it turned out to be a dead 12.395 Mhz crystal (that controls 80m). I could adjust the bias but there was not RX or TX on 80m

Thanks for all the friendly advice gentlemen. I think the missing link was hinted at by Gary KC0NPJ - I did not notice that switching the standby switch to "SEND" does not activate the Tx in CW mode (that comes several pages later in the manual). So special thanks to Gary, and as Homer Simpson would say "DOH!".

One other question. When I tune up on 40m per the procedure in the booklet, I get a dip on the plate current but the pointer on the knob is down in the 3.5Mhz range. I assume I should ignore the knob and go with the meter?

Check that your pointer is lined up with the capacitor plates... you will have to unplug the radio, LET IT BLEED OFF the hi-v, and look inside the final cage... with the plate tuning cap fully meshed, the pointer should be at 9 o'clock. While you have the covers off, blow out any dust from the PA cage and give the rig a good lookin' over, top and bottom.

Use a good #2 Phillips-head screwdriver.

Yes, I will give the plates a look. I find the CW sidetone to be too loud so I need to pop the hood to reach the sidetone volume adjustment. Also, I have a slight problem with the lamp on the S-Meter that is probably just a loose connection or oxidation on the bulb so I have a few other chores to do inside. That is my project for next weekend.

Thanks for the warning about HV inside the box, but I am afraid I discovered what capacitors do the hard way about 30 years ago while working on an old TV set. You only need to discharge them that way once to learn your lesson.

Hello Bill,

Using this method in 20 meters into a dummy load my TS-820S gives me at absolutely max smoke exactly 220ma and 80 watts.

I guess that means that I should start looking for a pair of new 6146B's, right?

Jose Pedro Alvarez
CA3RVF
Santiago, Chile

> As for testing them, here's my method:
> SSB mode. TX into dummy load. Idle current should be 50-60 mills. Raise idle current with the bias control momentarily to 150-200 mills. Unkey very quickly and let tubes cool for ten seconds. Key up again, watch plate current. If it stays up there for 2-3 seconds, unkey. You have good final or finals. Reset bias to normal.
>
> Next, tune up into dummy load for max smoke. Unkey, let it cool ten seconds, then switch meter to ALC. Key up again in CW mode. Watch ALC meter. If it comes up and then dives back to the left, you have a bad DRIVER tube. If it stays up, driver is good.
>
> Now load up for max smoke. You should see at least 220mA of plate current and 80-125 watts of output on 20M. If less plate current and power at absolute max, one or both finals are shot. Replace both.

Maybe not... does the plate current or output power start to decrease after a few seconds of transmit at this level? If not, it could just be low line voltage at your house. Check with a good meter. The radio may be wired for 120vac or 240, what is your line voltage read?

73,

Bill

Hello Bill,

As usual you were right in the spot. I still have to check the wiring on the rig, to see if it is wired for 220 or 240 volts, but the voltage in my house is lower than expected. The voltage should be 220 volts, but in the winter at nights when the demand goes up the voltage drops to 202 to 208.

I have voltage regulator that I'm currently using to connect my home PC and 17 inch monitor. I'll remove the monitor and run the TS-820 through it as soon as I can make a proper cable, as the output plug in the regulator is the female triangular computer tipe (dont know the proper name). That way I will assure a clean, stable 220 volts to the radio.

The plate current and RF don't decrease or jump in the meter in the rig, but in cw mode the power meter on the AT-230 will jump to 100 watts and then inmediatly fall back to 80 watts.

Jos? Pedro

Jose,
The plate current and RF output on the rig should coincide with the AT unit indication, I would think.

472. What is the mic connector and pinout for the TS-830S?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-05-29 02:56:53 UTC
From: w8nflists
Topic: 472 Message: 472

Hi all,

I have to build some interface cables for Field Day for the club's TS-830S rigs. But I won't get my hands on the rigs until Field Day! So I need to know what it uses as a mic connector (4 pin Import standard? Or 8 pin? Or something else?), and what the pinout is. The immediate need is just the type of connector, so I can get them ordered. Pinout can come later.

I have a TS-850SAT, but I think it uses a different mic connector - it's 8 pins, as it has up/down buttons on the mic, and I don't think the '830 does.

TIA!

73,

Dave W8NF

Hi All, I need some help in learning how to tune the TS-830s. I have the rig running to a MFJ 1788 loop. I 'm not quite sure on the procedure of tuning this rig, especially on phone operation. My antenna tunner has no dummy load. Do I tune the antenna first and then the rig? Or the other way around? Do i use CW to tune for phone? Please help Thanks

My 530s has a four pin mike connector. I can make you a copy of the page in the book and send it to you by e-mail, if that would help.

477. HELP ? Freq. Display wrong readout

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-05-30 17:08:08 UTC
From: Lee McDaniel
Topic: 477 Message: 477

Hello all,

Has anyone every seen the problem where the freq display goes to 13.500 on sat 20 meters but the radio transmits fine and receives fine but you can not see your freq. All bands do the same. Turn radio off leave 10 min back on its OK for about 10 min then the same thing all over again. I plug in the remote VFO and it does the same thing, main radio display sets at 13.500 (20 meters) and never changes. 40 is like 6.500 and so on.

Iam going to pop the lid and check all connections on the display board but if that does not do it, I will have to re-think.

ANY IDEAS, or has anyone ever seen this.

Thanks Lee wb4qoj

478. Continued sporadic output on 830S

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-05-31 02:07:57 UTC
From: Filmhog

I have an TS-830s that has no output on 40m, 15m and 10. I replaced the coupler so the shaft is secure on the band dial. I have resoldered the connections to the driver tube. I do have alc meter readings when cw is set and on operational bands.
What is next to try. In my messing with the band switch, I randomly got the bands to work and 10m is not working now since I put the new coupler on the shaft.
1. is the setting that critical for the mating of the band switch shafts?
2. I had sporadic output on the 15 and 40 after using contact spray and then it went away.???
What would be my next check? Could I have the shaft in 180 degrees? I didn't do that but received this radio with the no xmit problem on 15 and 40. Like I said, 10 just went away after my coupler "repair".
Thanks for any help. (thanks to Bill also for the fixes)
Jan N6YV

479. Re: [TS-520_820_530_830] Continued sporadic output on 830S

Topic: 478 Message: 479

Given that the problem got worse with the coupler change, I really think that at least on ten meters that the bandswitch is part of the problem. Check for bad solder joints around the switch.

If the switch were 180 out, 160 and 80 probably would not work.

The only puzzling problem I had on my TS-830 was caused by dirty contacts. Try giving the band switch a good cleaning with contact cleaner move the switch around a bit. Do the other switches too, and the pots too as long as you have it open. Cured all my rig's problems except one that I caused myself (!)--and I know how to undo that one the next time I have it open.

I know this may start some opinionated discussions but.....

I use WD-40 as a contact cleaner and lub. It works great and have never had to "reclean" after using it once. The key is to keep the amount to an absolute minimum. Wipe up any excess sprayed.

I have not seen any "gumming" effects from using it. I have used in my MFJ roller inductor tuners, my 820s, FT-101s, and the 830s. I use it on SPST switches ect., pots, and waffer switches as well. No negative side effects to date. I have been using it for several years now.

Good Luck,

Rob

I always use contact cleaner since it leaves no residue. Don't know about De-Ox.

I haven't used WD-40, but would be concerned about oily residue and its tendency to collect dust. The fellow who recommended it said he uses very small amounts

You can spray any or all switch contacts and pots. But: NEVER NEVER NEVER get spray on the variable capacitors.

Alan

Alan and gang,

I use Cailube for all my switch and contact cleaning needs. Seems like once you use that stuff, you never have to go back again with it.

I don't like spraying switch wafers as they can absorb the liquid and swell up, and this stuff doesn't go away.. not like water or alcohol... Can seize the switch wafer, from which there is no return. Instead, get some foam swaps, as for cleaning video or tape heads; soak the swab in the solution and then dab it on the metal parts only, as much as possible avoiding contact with the phenolic wafer material. Werks fer me!

Spray into carbon controls, no problem... i use small pieces of rag or soft paper towelling to catch overspray and drips, then another foam swab to mop up any thing i missed. Why have a goopy oily radio after trying so hard to fix it? hi

One of the positives I have found with WD-40 is that it gives a lubricating effect to swithces and pot that is why I only have to treat them once.

At least that is my experience.....

I think I wrote about this in the past, but did you try gently rebending the contacts on each wafer to make sure you get good contact between the rotary part and the crimped part? Try it on a single known "bad" or intermittant band first. Check each wafer and note the contact closures on each wafer and each band, then move the bandswitch and watch to see if each contact moves up as the switch slides under it.

Also, there is another thing that happens and that is electrolysis between the dissimilar metals of the contact and the rivet. If you live in an area prone to humidity, then that is also a possibility. The fix for that is a very small drop of conductive paint applied to where the contact meets the rivet. I bought some paint which is used to touch up PCB traces (some Fry's carry it), but I've heard that the silver paint used in model railroading works just as well.

The combination of both made my "half-working" 830S to become a fully functional 830S.

Good luck,
Roy

Thanks for the tip Roy,
I will go get some of that trace paint. A Fry's is close. When I go into the PA cage, the three band switches are quite close. How do I know which bands switch to concentrate on for the various bands. Or, is there documentation available that is a roadmap to which bandswitch does what. I am concentrating only on the what appears to be, three bands switches.
Thanks
Jan N6YV

The band switch pc boards that I fiddled with were the ones OUTSIDE
the PA cage. I needed a good penlight and strained my neck to look
down in between the switch boards to see which ones were engaged on
whatever bands were acting up.

In my case it was several bands above 20 meters, especially 17, and 10
meters, but 40 was sometimes intermittant. So for 17 meters, I would
switch between 20m and 17m and see which contacts were being engaged.
Those were the contacts I "fixed".

490. Tuning with a tuenr in-line

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-06-02 20:24:57 UTC
From: Jim
Topic: 490 Message: 490

Bill and friends,

Now that I have received the last in this round of shack purchases, let me run through what I think the correct procedure is for tuning up my new rig (an 820S) based on a read-through of some old messages on here. I begin by assuming the first attempt at tuning is done into the dummy load, correct?

1. In SSB mode, switch to send, check the bias is 60ma.

2. Change mode to tune, meter to ALC, adjust drive control for peak.

3. Meter to IP, still in tune mode, adjust the plate current to dip.

4. Mode to CW, meter to RF, key the Tx, alternately fiddle with the plate and load for maximum output.

5. Now, here is where I get a bit confused reading the past message threads. Am I to understand that the first tune-up is done with the CW carrier knob around 12 o'clock or a bit less? Then, I
crank over to full clockwise and tune again for "max smoke"? I
assume the term "max smoke" just means absolute highest CW output.

6. Disconnect the dummy load and repeat step 5 for "max smoke"
by connecting directly to the antenna, and not going through the antenna tuner circuits.

7. Finally, switch into the tuner circuits and, if necessary, adjust for minimum SWR.

If it matters, I am using a 40m dipole fed with 50 ohm coax into a balun but that is soon to be replaced by a 160m dipole fed via 450 ohm ladder line.

Am I on the right track here? How far should I let the RF meter deviate on "max smoke"? Is anything near full scale but somewhat short of a full right peg OK?

491. Re: [TS-520_820_530_830] Tuning with a tuenr in-line

Topic: 490 Message: 491

Hi Jim,

It's raining here just now, so I have a few minutes to try to help... I have an 830...

Couple of preliminary thoughts... First... EVERYONE should tune into a dummy load if at all possible... a cantenna works just fine... Secondly, start the tuning procedure with the Load Control fully counterclockwise... sharper plate dip that way...

I think the problem is in Step 2... My manual says to operate the Carrier control to put the meter at the top of the ALC window...

In step 4, I prefer to keep the meter on Ip... tune for a dip, key down in CW (note that the Send switch does not accomplish this... you must key down)... increase the load control, dip again, etc., until you have about 230-240 mA of plate current. If you then want to check Po to see if the tubes have a little more in them, by all means do so...

The next comment regards the antenna tuner... If you know that the SWR on your antenna is 3:1 or less, you can connect directly to the antenna... (some folks say 2:1)...

In setting up the antenna tuner initially, I run key down, but with the load control CCW... that way I am not stressing the finals with wierd impedances.. at least not too much... Run through all the bands you intend to operate and note the settings that give you the best match... jot them down somewhere handy... (mine are in big bold print on my bulletin board so I can see them at a glance... That is for when I am running on the G5RV...) Then, when switching bands, PRESET the antenna tuner controls at the settings recorded.. they will be close, but may need a little tweak, depending on moisture, wind, etc...

Tubes like to run heavily loaded... some actually load a little past peak plate current... (plate current begins to decline slightly...)... I usually just watch the Po on my tuner forward power meter (split needle).. and tune until I have peak power out... (Bill did the QRO mod on my 830, so my meter shows about 150 W out on all bands except 10M...) Have had no complaints on the signal at all.

For the audio on SSB, I use the monitor function and listen to myself.. I adjust Mic Gain and the compression level on the speech processor until it sounds good to me... at the moment, Mic Gain is at about 10:30, and the processor is about the same... check the comp position on your meter... (does the 820 have that??)

Well, I hope this rambling narrative is helpful... and I always stand to be corrected by the real gurus here... Learn something almost every time..

Raleigh,

Sorry about the rain, but thanks for the tutorial. There are lots of tricks to learn, but this site seems to have a lot of friendly Elmer types and for that I am very grateful. A few follow-up questions:

- Maybe there is a difference between the 830 and the 820, but for step 2 my book clearly says to peak the meter with the DRIVE control. Perhaps another 820 owner can comment.

- I understand the part about building a cheat sheet for antenna tuning; I think I will leave that until my 160m G5RV is up. However, what is the definition of "best match". I have an MFJ cross needle, and the "best match" when measured in SWR is not necessarily a nice peak on the power out. Is is safe to peak the forward power and forget about the reflected so long as I am below 3:1? My dipole is cut for 40m but even then I do not get much lower than 3:1 over much of the range. Granted, I am tuning up a phone segment and the dipole was built for a CW rig but I was trying to tune 7.160 which isn't that far out of CW land.

- As for the 820, yes it has a Comp scale on the meter. What kind of reading should I be shooting for?

Don't worry about being corrected by the gurus here since you don't have to know much to keep ahead of me. We all learn something every time we connect to the Internet. Thanks for taking the time to reply.

73,
Jim

Hi Jim,

The drive control should be pretty broad in its tuning... I usually get mine close enough just by listening first and peaking the incoming sigs with the Drive Control... but I always touch it up to make sure...

Gotta be a little careful with the SWR data... with high SWR, your meter is probably reading both the forward and reverse power in summation... Best match is MINIMUM SWR... But, if you look at it...200 W forward and 2:1 SWR is 20 watts reflected... or 10%... scale for 100 W... so at 2:1 you lose 10 W... no big deal really... but purists will go the the lowest SWR or 'flat match'.... but that does not tell you what the conditions are on the feedline... only what the conditions are on the line going to the transmitter... When you get your 450 line installed, it may run at quite high SWRs... and even be a substantial portion of the radiation... depending on various lengths and frequency combinations... I have even had my little standard G5RV (actually a 20 meter extended double zepp...) loaded up on Top Band... and worked a couple of stations on it... not good, but possible... think it was operating then as a top loaded vertical... hehe

You did not say how high your dipole was... the feedpoint impedance changes with height above ground and the nature of the ground... It can be 100 or more Ohms or 30 Ohms.. and you are feeding it with 50 Ohm line... so, you have a guaranteed mismatch to some degree... The impedance of a dipole in free space is about 72 Ohms... and lots of folks feed them with 75 Ohm line... The transmitter Pi Network output can generally acommodate the difference...

Again, if you want flat to the transmitter...just run your tuner in line all the time... then you will be flat across the band... I use a Bobtail Curtain... three vertical elements in phase, fed at the voltage point.. .(i.e. the end closest to the ground...).. It looks like a capital letter E rotated 90 degrees clockwise... fed on the middle prong via a tank circuit.. nifty antenna with 4.8 dB gain and very low radiation angles... have one for 40 and one for 20... use verticals for 15-10... and dreaming up a full size vertical for 80 for the wintertime... maybe I should top load it and try for 160 as well... will be 67 feet tall...

My bobtails are both cut about 150 kHz up from the bottom of the band... and the SWR on them is less than 1.5:1 across the whole band..

I am also a nut about grounding... I think it makes any antenna work better... I have 4 eight foot ground rods... spaced about 40 feet apart, and connect with some old #8 copper I found laying around... that takes care of the DC part... for the RF ground, I use chicken wire... as much as I can lay down... scalp the lawn first, use lawn pins to stake it down, and wait for the grass to grow up through it... then just mow normally... but not to short... at the moment, I only have about 1000 sq.ft. of chicken wire down... but at an auction recently, I bought about two miles of copper wire... think it is steel with copper cladding... some #8 and some about #18... gonna use those for radials for my 80 m vertical and of course it will be tied to the whole RF ground scheme... very important if you are

going to work 160...

On the Comp... my rememberance is that it is not supposed to go over the ALC box on peaks... will have to dig out my manual and check...

Raleigh,

Sorry about the rain, but thanks for the tutorial. There are lots of tricks to learn, but this site seems to have a lot of friendly Elmer types and for that I am very grateful. A few follow-up questions:

- Maybe there is a difference between the 830 and the 820, but for step 2 my book clearly says to peak the meter with the DRIVE control. Perhaps another 820 owner can comment.

- I understand the part about building a cheat sheet for antenna tuning; I think I will leave that until my 160m G5RV is up. However, what is the definition of "best match". I have an MFJ cross needle, and the "best match" when measured in SWR is not necessarily a nice peak on the power out. Is is safe to peak the forward power and forget about the reflected so long as I am below 3:1? My dipole is cut for 40m but even then I do not get much lower than 3:1 over much of the range. On ALC, when peaking the drive, you may have to reduce the carrier control to keep it on-scale for proper tuning. After that, it's MAX SMOKE BABY.

I would do the MAX SMOKE tuning into the antenna; since you are going to have to do it anyway, why put excess wear on the finals?

Other than that, you got it down. Care to polish it and post it in the FILES section? hehe

You ask a question, we put ya to work!

Jim <k1zc@...> wrote:
Bill and friends,

Now that I have received the last in this round of shack purchases, let me run through what I think the correct procedure is for tuning up my new rig (an 820S) based on a read-through of some old messages on here. I begin by assuming the first attempt at tuning is done into the dummy load, correct?

1. In SSB mode, switch to send, check the bias is 60ma.

2. Change mode to tune, meter to ALC, adjust drive control for peak.

3. Meter to IP, still in tune mode, adjust the plate current to dip.

4. Mode to CW, meter to RF, key the Tx, alternately fiddle with the plate and load for maximum output.

5. Now, here is where I get a bit confused reading the past message threads. Am I to understand that the first tune-up is done with the CW carrier knob around 12 o'clock or a bit less? Then, I crank over to full clockwise and tune again for "max smoke"? I assume the term "max smoke" just means absolute highest CW output.

6. Disconnect the dummy load and repeat step 5 for "max smoke" by connecting directly to the antenna, and not going through the antenna tuner circuits.

7. Finally, switch into the tuner circuits and, if necessary, adjust for minimum SWR.

If it matters, I am using a 40m dipole fed with 50 ohm coax into a balun but that is soon to be replaced by a 160m dipole fed via 450 ohm ladder line.

Am I on the right track here? How far should I let the RF meter deviate on "max smoke"? Is anything near full scale but somewhat short of a full right peg OK?

Raleigh,

Thanks for the clarifications. I hear ya about grounding, but I only have the one line into a buried ground stake. While that is not ideal, I have a unique house that makes for some interesting challenges.

I didn't say how high the dipole is because I am not sure how high the new one will be (the old one is much too low to accomplish much of anything). I live in a heavily wooded lot near Lake Michigan with the house at one level, and 70% of my property is in a ravine. The bottom of the ravine is maybe 70 feet below the grade where the house is located, but there are plenty of 150 foot oak trees all around. The drop from the house is STEEP, in some cases it is straight down!

So, if my friend is as good with his crossbow as he says he is, the dipole will be maybe 40-50 feet above house grade, but more like 110-120 feet above the ravine floor. I am hoping the steep slope will give me a nice low takeoff angle since I have unobstructed shot to the NE out over the lake. The ladder line will not drop straight down, which I know would be ideal, but it will come as sort of a 45 degree angle towards the house. I don't think anybody can figure out what the reflections and uneven ground are going to do to the radiation pattern and feedpoint impedance by just looking at this site. Time for a little experimentation - I am just going to get it up as high as possible and deal with the consequences.

73,
Jim

Hi Jim and thanks for the clarification...

Sounds like a real nice spot.. On the crossbow... be sure you have plenty of line on the bolt... I tried it here, but had not enough line...
If the soil is rocky, think seriously about the chicken wire screen... you will need the good ground to work against...

As to height... well, my G5RV (or whatever it is) is only at about 30 feet at the apex and the ends are about 14 feet... and in the DX contest I worked well over 100 countries... so so works sometimes... but you are right... the higher the better...

Also, if your dipole is cut for 160... or about 133 feet per leg... on the higher bands, it will be multiple wavelengths long... you will start to see lobes at 35-50 degrees off the axis of the antenna, instead of the normal broadside radiation... sounds like fun...

Good luck, and I hope to hear you on sometime...

But, if you look at it...200 W forward and 2:1 SWR is 20 watts reflected... or 10%... scale for 100 W... so at 2:1 you lose 10 W... no big deal really... but purists will go the the lowest SWR or 'flat match'.... but that does not tell you what the conditions are on the feedline... only what the conditions are on the line going to the transmitter... When you get your 450 line installed, it may run at quite high SWRs... and even be a substantial portion of the radiation... depending on various lengths and frequency combinations... I have even had my little standard G5RV (actually a 20 meter extended double zepp...) loaded up on Top Band... and worked a couple of stations on it... not good, but possible... think it was operating then as a top loaded vertical... hehe
>
> You did not say how high your dipole was... the feedpoint impedance changes with height above ground and the nature of the ground... It can be 100 or more Ohms or 30 Ohms.. and you are feeding it with 50 Ohm line... so, you have a guaranteed mismatch to some degree... The impedance of a dipole in free space is about 72 Ohms... and lots of folks feed them with 75 Ohm line... The transmitter Pi Network output can generally acommodate the difference...
>
> Again, if you want flat to the transmitter...just run your tuner in line all the time... then you will be flat across the band... I use a Bobtail Curtain... three vertical elements in phase, fed at the voltage point.. .(i.e. the end closest to the ground...).. It looks like a capital letter E rotated 90 degrees clockwise... fed on the middle prong via a tank circuit.. nifty antenna with 4.8 dB gain and very low radiation angles... have one for 40 and one for 20... use verticals for 15-10... and dreaming up a full size vertical for 80 for the wintertime... maybe I should top load it and try for 160 as well... will be 67 feet tall...
>

> My bobtails are both cut about 150 kHz up from the bottom of the band... and the SWR on them is less than 1.5:1 across the whole band..
>
> I am also a nut about grounding... I think it makes any antenna work better... I have 4 eight foot ground rods... spaced about 40 feet apart, and connect with some old #8 copper I found laying around... that takes care of the DC part... for the RF ground, I use chicken wire... as much as I can lay down... scalp the lawn first, use lawn pins to stake it down, and wait for the grass to grow up through it... then just mow normally... but not to short... at the moment, I only have about 1000 sq.ft. of chicken wire down... but at an auction recently, I bought about two miles of copper wire... think it is steel with copper cladding... some #8 and some about #18... gonna use those for radials for my 80 m vertical and of course it will be tied to the whole RF ground scheme... very important if you are going to work 160...
>
> On the Comp... my rememberance is that it is not supposed to go over the ALC box on peaks... will have to dig out my manual and check...

Hey all,

I realize the bands are pretty sparadic lately and everyone's shedules are probably very different ,but it may be a great help to alot of us (not to mention probably alot of fun) to set up a semi-regular time/frequency where we could possibly meet up on the air. Any takers? We could rotate Net Controllers etc. Just a thought anyways.

Hi Group...

Well, we need a survey...

Time: Early Morning, Mid Morning, Noon, mid Afternoon, Early evening, late evening...
Frequency: Montly, Bi-monthly, Weekly, Daily
Band: 80, 40, 20, other (choice of op freq.)
Mode: SSB, CW, Other
Day of the week: Weekday choice, Saturday, Sunday.

My votes are:... Early Saturday mornings, 40 or 20, SSB, Bi-monthly,

for what it's worth..

Frequency: Bi-monthly.
Band: 20, 40, 80 preferred in that order.
Mode: SSB, unless you are prepared to listen to a constant stream
of "QRS" from a certain station in the Midwest.
Day: Saturday 9:00 Central (14:00 Zulu) works for me, but maybe a
little early for the West Coast folks. Second choice is evening,
say 8:00 or 9:00 Central (01:00-02:00 Zulu), any night but Thursday.

73,
Jim

sounds like a volunteer to me!!

Would suggest 40 meters because of the wide range of locations of everyone
or maybe 80. SSB would be good or PSK31 might work better than SSB if
everyone is set up for it

Hi Gary:

I'm sure you probably know this already, but it's worth a shot in case you don't.... Check that the mode switch on the keyer isn't set to "semi" (if it has such a setting anyways).

I was keying the 530 with an MFJ422b keyer. At one point the dash maker would no longer work, the dits seemed to be ok. as soon as I powered down the radio it was ok again. Either the keyer will not handle the 530 or could I be getting rf into the keyer. Any suggestions?

I make them but remember, the American "jones" plugs are numbered backwards to the JA type... Pin 12 becomes pin 10, etc. 1 is 3, you get the pic.

I always check them with an ohm-eater.

rkkennard <rkkennard@...> wrote:

Does anyone know where can a person buy a power plug for a Kenwood TS-820S ?

thanks

Randall

Best thing is just to send out freq and invite for particular day or night, and see what happens.

It's now 8:48pm mdt Weds PM and I am listening on 7255.

I suggest an RF problem in the keyer. See if reducing power will help.

Also dummy loads are great for t'shooting RFI issues!

522. Is there an easy way to do this?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-06-07 21:50:23 UTC
From: Jim
Topic: 522 Message: 522

I have a minor problem with the light bulb next to the multi-purpose meter on my TS-820S - it seems like it is loose in the socket or the connection is dirty or oxidized. A gentle "thump" on the cabinet will make it come back on although that is probably not the Kenwood approved technique.

I popped the hood today to look at something else and I was hoping that I could get at the bulb by simply removing the top cover. However, it looks to me that I have to remove every knob from the front of the unit and then remove the faceplate to get to it. I figure if there is an easier way to do it, somebody here will know.

73,
Jim

Jim:

If it's anything like the 520, you will see that the bulbs are held in by a small rubber "thingee" (probably not the official Kenwood part name) in which the bulb fits into the middle and can be easily pryed out. The bulbs in my 520 were burned out when I bought it at a HAMfest, and when I took the unit apart, it seemd to me also that I'd have to take the whole front off to get at the bulbs. Not so when i noticed the way the bulbs were actually held in place. Anyways, you can pick up such replacement bulbs at an electronics surplus shop for a buck or two that are already wired. You just have to snip the wire that's currently attached and solder the new one to it. IF you can't find the bulbs at a surplus shop, Model Train stores also sell them, although they're a little more expensive there. Has worked great for me ever since.

Hope this helps,
Pete

Greetings,

I have had this TS-820S for 10 plus years and so far have been able to fix every problem but this one. Help.

I just noticed when I move the meter switch to HV received signals cause it to peg. If I turn the AGC off HV reads normal. I scoped the meter and found what appears to be
audio on it and I followed the schematic back to pin 14 of connector IF3 (SM) on the IF board which goes to the collector of Q5. Does anyone have a clue why audio is getting into the meter circuit while I'm reading HV and how to fix it?

Thanks,

Bob WA6OJJ

I thought these bulbs poked into the back of the meter through a grommet?

BTW they do get intermittant before they fail.

I found them and you guys are correct, they feed in through the back of the meter via a grommet, although my teenage daughter refers to grommets by the proper technical term "little rubber thingy". I was looking for the wrong mounting since I was expecting to find a little socket for a bayonet bulb like on my Heathkit gear, but these are a bit different (who the heck figured it was a good idea to solder them in?)!

You learn something new every day.

Now that you found it, here's how to fithit:

You can follow the lamp leads way down into the innards of the front panel where they are soldered onto some PC pads; or, do it the technically incorrect but much easier way (which fits the amateur-repairs group standards) by cutting the wires near the old bulb (power off, of course!) and then putting on one 1/2" long piece of heat shrink on each lead of the new lamp, cutting and stripping the mating ends of the wires to about 1/4" length, tinning all four wires, and then lap-soldering them together (wires parallel, overlapping each other most of the tinned length, then run small bead of solder along them. Takes a little practice but makes a super-neat splice). Then, you know what to do with the heat shrink tubing.

Of course, if you soldered all four wires TOGETHER, it will short the lamp circuit out, but you knew that, too.

Please don't twist the leads together and then use 2" of cheap electrical tape that will, on the first hot day, melt the adhesive and ooze it all over everything and every body that gets within two feet of the radio.. that does NOT fit the amateur-repairs group standards, even if you attempt to bind the wires first with a glob of plumbing solder and a match.

(Apologies to August and Howard)

73!

Yep, somebody has already "been there and done that" using the time honored "cut the wire and use lots of black tape" trick. Not sure I ever like to see electrical tape on anything, except as an extra wrap around when I replace a 120V AC light switch.

I will try the more elegant lap soldering technique. Too bad somebody doesn't make a tiny connector that is readily available - I have seen some used on disk drives and such that would be perfect. Oh well, I guess I won't have to do this very often so if ain't broken I won't fix it.

These are 12V lamps, right? Anybody ever try replacing them with the red and green lamps for a festive look at Christmas hi hi?

Yep, 12v... and if they seem to burn too brightly (you can't look at the filament), stick a 33 to 100 ohm, 1/2 watt wire wound resistor or 1 watt MOF in series. They will last longer. If you have nail polish (and who doesn't?) you can try all sorts of colors. Stay away from pink or purple; it will shorten the life of the radio (if I see it). hehe

Gary, you can use just about any old hand mic, unless you want a Kenwood original type. for that you will need to look on eBay, or you can still buy the MC-43 which works great but will have to be re-wired for the 4 pin mic connector.

If you can find an old Shure hand mic that you like, pick it up. Even an old Motorla or GE mic will work and you can put in a Heil element and really have something!

533. Is the TS-830S grid-block keyed?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-06-12 00:12:20 UTC
From: Dave W8NF
Topic: 533 Message: 533

I'm building some interfaces for Field Day and need to key both the TS-830S AND a TS-850S from the same PC (with a switch). The TS-850S has a positive voltage that is pulled to ground to key the rig. To my knowledge, mainstream standard for solid state rigs.

The old all-tube rigs used grid-block keying. In that system, there was typically negative 100 volts on the keying line, and when you closed the key, you were conducting mere microamps of current. On my Drake B-line, for instance, merely connecting a DVM to the keying line to read the voltage would actually key the rig.

But I am not certain about the hybrid rigs like the TS-830S. I have the operating manual, but will not have the rig until Field Day. I have been unable to find the answer in the operating manual - it's probably there but I can't see it.

So, does anybody know? Do I need to build the TS-830S interface to be able to key a negative voltage or positive?

Thanks!

73,

Dave W8NF

DAve, the 520 through 830 use 12v to kick a relay. Same interface as the 850, just make sure it can handle a couple hundred mA.

REally! I thought they all went to a 12v relay! yikes, better get my skem out and look.

uh, a little reed relay should do the trick for both positive and negative keying, or you can look at any of the keyer projects for idea on how to do it with transistors.

Topic: 538 Message: 539

Gary,

Good luck with it. I finished up about 30 minutes ago, now I have two bright shining lamps in my S-meter, but it was a bit more challenging than what was described.

There are indeed rubber grommets, but the bulb does not just pop out (at least not on the TS-820S). The lamps have two tiny wires and you need to thread these through two equally tiny holes in the rubber. While it is relatively easy to pull the grommet out from the back, reinserting with the new bulb in place is quite the challenge. I finally gave up and pulled the face plate, and with it all the knobs.

It might be possible to do it from behind with the right lamp, but the ones I got at Radio Shack are long enough that they make a reinsertion from the rear nearly impossible. You need to come in from the top at an angle with the pair I got, hence removing the face plate. BTW, the Radio Shack part number is 272-1141 if you want to call first.

Do use the procedure suggested by Bill and get some nice tight heat shrink, the previous owner had gone the black tape route and everything inside was kind of sticky and gooey. Since the wires are tiny, make sure you have some shrink tubing that is small enough before you start. The heat shrink I used on my first attempt would not shrink enough to stay put.

Besides a soldering iron and several screwdrivers, I found that a nice cold gin and tonic makes the job go easier.

73,
Jim

James on a TS530 and TS830 when using the 7 pin DIN remote socket, pin 2 = gnd and pin 6 = ALC input.

I use a PP3(9v) battery. The positive side from the battery is wired to ground (pin2) and the negative supply is wired via a switch and a pot to the ALC input (pin6). I have used this on both a TS-530S and a TS-830S in order to switch from full power (when tuning in to a dummy load) to a adjustable QRP power.

Topic: 533 Message: 548

Hey Bill, maybe I need to ask my questions differently. I asked if the TS-830S was grid-block keyed - not whether it was capable of keying a grid-blocked amp.

The correct answer, which I *finally* found in the TS-830S operating manual (I have a .pdf, not a printed copy, so it's kind of hard to scan through) is that the TS-830S is, indeed, grid-block keyed. Kenwood's own specification says that when your morse code key is open, negative 65 volts will appear across the terminals. Therefore, the standard (modern) keying interfaces from most keyers won't work, since they're designed to key only positive voltages.

Glad I found that out..now I know that I have to build some positive-to-negative keying interfaces.

The only thing that's bugging me now is that I'm only getting the info I need, and we are precious days away from Field Day.

More questions, but in another posting, because they won't fit under the present topic..

Hello, TS x2/30 enthusiasts!!!

I just took delivery of a TS-830S from the inventory of the club for whom I'm captaining the 40 meter Field Day station.

It's always a lot of fun plugging in a rig that's new to you, particularly if it's a nice one. I really like this radio. The receiver is MUCH more pleasant to listen to than my TS-850SAT, and the IF filters seem sharper. The receiver is more "alive", less compressed. Not as sensitive, but plenty sensitive enough. And you can tell how loud a signal is by listening - you don't have to watch the digital S-meter.

However, this particular example is not ready for prime time. During my listening, I noticed a fair amount of frequency instability, and some weird static like sounds. I finally traced them down - the "FIX" switch is dirty, causing the frequency shifting, and the "RF.ATT" switch is dirty, causing the static-like sounds. There are a few other dirty controls, too.

So, the question is this - I'm going to have maybe an hour to fix this. Can I do it? If I just pop off the covers, can I get in to those switches and carefully apply some ProGold? Or is it a major disassembly to get into the front panel area of this rig?

Otherwise, this seems like a great rig for Field Day. Only a few too many controls for someone unfamiliar with it and no nasty memory buttons to send you off into never-never land, confusing a beginner.

Thanks for all the help.

Best bet, take off the covers and check to see if you can get to the switches. I don't recall ever having to take the front panel apart to clean any of the switches on these.

After you do that, sweep any band with the VFO and with the CAL on. If you hear anything but clean heterodynes as you tune across each marker, your VFO is dirty and the contacts on the variable cap will need to be cleaned. That is a little harder.

Hi,

The only switches I could not clean on my 530s was the Mode switch,
otherwise you can hit all the pots and switches like Bill suggested.

The mode switch is pretty well sealed, usually doesn't need cleaning but I have heard them get noisy now and then.

Best thing as with all older rigs is OPERATE IT now and then... they HATE sitting on the shelf with no one to twiddle the knobs.

Bill

Bill,

Nope, I'll be with a local club - W6KB, as in "kick butt" LOL. If you hear us on 40 meters, it'll be the '830 I'm presently working on, probably. I may not be the op, though, I'm working at getting as many low-activity hams on the air as possible. Probably will see most SSB during the day, and CW at night, because of the nature of 40 meters.

I rigged up a cheap headset/boom mic from a PC headset. A bit frustrating - turns out PC microphones need some DC bias, so it was another hour, and I have an air-wired rig with resistors and a 9 volt battery putting it all together. With our crew, there's no doubt someone's going to end up operating and logging as a one-person arrangement, and the headset/boom mic should help. Keep the hands on the computer keyboard, work 'em and log 'em. But what do I know? I'm a CW op...

LOL

Hope to see as many as possible on the air this weekend.

Hi Dale,

Sorry about that - it is my fault. When I uploaded the file it had the
name:
"TS-830S_Instruction_manual@..."

After uploading it, I changed the name to simply remove the "@549" part,
since that made no sense anyway.

The best way to get the file is to simply go to the group's homepage,
then enter the file area, and you'll find the file (and other files) in
the TS-830 folder.

Sorry about the confusion...

73,
Alan W2AEW

Oh yeah.. one other thing about .pdf files.. if you
try to save them off the Web page and the overall path
name that your computer tries to assign is greater
than 65 characters, Adobe pukes and says basically,
"your disk is full", when it really means, "Use a
shorter path silly!".

To work around this, I save it to "my computer" and
then whatever the root directory is for that... then
later I move it where I want it.

562. TS-520 Accessories Questions

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-06-27 22:22:10 UTC
From: smrippe
Topic: 562 Message: 562

First, would like to thank Bill, K0ZL, for approving my membership to this group, and second, I would like to apologize to the entire group in advance for my ignorance with regard to Kenwood radios and accessories. I was recently offered a great deal on a pristine version of the TS-520, so now I am a proud owner of my first piece of Kenwood equipment.

My first question is this. Mounted on the back of the radio just under the fan is what I believe to be the DK-520 adapter for using the DG-5 digital display. The adapter has 3 "RCA" type jacks labeled "VFO" "HET" "CAR". It also has a 2 pin power connector labeled "Counter". Is my assumption correct?

I have been given an AT-250 antenna tuner that appears to be in excellent condition, inside and out, and I was told that it functions perfectly. Here is my second question. Can the AT-250 be used with the TS-520, and if so, what steps would be required to accomplish this task?

Thank you all in advance for you assistance.

Steve R.
Fenton, Michigan

Oh don't apologize. Without questions, this group
would have not much reason to exist I think.

Yes those connectors are for the counter. Keep eye on
eBay or at the hamfests, you will find one.

I am certain the AT-250 will work; does the AT-250
have a band selector switch on it? That is the main
thing, is telling the AT-250 what band you is on.

Bill:

Thanks for your response. I was fairly sure about the DK-250 adapter, but it is still nice to have a confirmation. All I need now is to find a DG-5. With regard to the AT-250, yes it does have a band selection switch with one position for the "Auto" tune function. I am still not clear if it will work with the TS-520 in the "Auto" tune position. If not, I should just get a lower cost AT-230 or AT-200 and sell the AT-250. Any ideas?

Regards,
Steve Ripper

You can sell the AT-250 and have enough from the sale
to buy an SGC-239 auto tuner! That will work with ANY
rig.

Your 520 will handle up to 3:1 without a tuner; it's
the nature of tube rigs. Say you have a G5RV, hook
right to the 520, and load it up for max output...

No tuner needed for minor SWR correction.

I have an SB-220 that performs the same function: 80M
dipole, 5:1 swr at the ends of the bands, the amp
works just fine and the ts-850 sees 1.5:1 into the
amp. Everyone is happy.

Norm

Just changed the one on my 530. If the 820 is the same , just open the hood and the bulb is in a gromet in the back of the meter. It is a twelve volt bulb, available at Radio Shack. Just cut and solder wires with heat shrink on them and presto "light".

I just relamped my 820 a few weeks ago. The grommets on the 820 have two tiny holes in the back and you need to lift them straight up out of the slit in the metal frame. Unfortunately, that required removal of the front panel, which in turn required removal of the knobs. It is more tedious than difficult, but it is the only way to attempt it if you want to avoid damaging the grommets.

Radio Shack part number is 272-1092 and you will also need some shrink tubing to insulate the place you solder the wires. You can use electrical tape (like the previous owner did), but it WILL get all nasty and sticky inside.

Gentlemen! The whole issue of meter lamps is just Kenwoods way of begging you to go but a new rig! I can't understand why, after 30+ years of abuse these lamps fail to function. Such quality! Seriously, the aforementioned fix is correct. I use a pair of hemostats to fish the lamp and wires into the correct position. I also tape an extra couple of lamps to the inside of the lid so, next time, I don't have to go to Radio Shack. That trip is becoming a chore since most everything for ham radio is where you pay first and they ship you the part. I run a 520 and also a 520S and love them both. These rigs will go to my son AE10 and hopefully to his son who is now 12 years old. And the fun will go on!

Any 12V "grain of wheat" bulb will work, see your
local hobby shop, take the old one with you.

Just chop the red wires, leave enough to get new one
lap-soldered in with some heat shrink (PLEASE don't
use tape, really makes a mess after a while).

You may have to cut the back of the rubber grommet
off, right up to the flare, so that you have a 1/8"
hole to stick the new bulb into, if it will not fit in
using the existing 2 small wire holes.

'snot that hard. get some 1/8" (unshrunk size) heat
shrink, that is the main thing...

i like lap-soldering the wires, that way the solder
joint slides right into the heat shrink tubing and
then you just hit it with the side of the soldering
iron, you done.. hardest part is taking the cover off.

Dang Bill, you did it now! My dial lights were fine till you went ahead
and mentioned it and now mine burned out on the main tuning dial LOL

Just because you brought the subject up!

But, glad you gave the great tip, at least it will be not as hard to
change them.

Mike

---------- Original Message -----------

Now that you found it, here's how to fithit:

You can follow the lamp leads way down into the innards of the front panel where they are soldered onto some PC pads; or, do it the technically incorrect but much easier way (which fits the amateur-repairs group standards) by cutting the wires near the old bulb (power off, of course!) and then putting on one 1/2" long piece of heat shrink on each lead of the new lamp, cutting and stripping the mating ends of the wires to about 1/4" length, tinning all four wires, and then lap-soldering them together (wires parallel, overlapping each other most of the tinned length, then run small bead of solder along them. Takes a little practice but makes a super-neat splice). Then, you know what to do with the heat shrink tubing.

Of course, if you soldered all four wires TOGETHER, it will short the lamp circuit out, but you knew that, too.

Please don't twist the leads together and then use 2" of cheap electrical tape that will, on the first hot day, melt the adhesive and ooze it all over everything and every body that gets within two feet of the radio.. that does NOT fit the amateur-repairs group standards, even if you attempt to bind the wires first with a glob of plumbing solder and a match.

(Apologies to August and Howard)

Hello Everyone,
I have a TS-820S and the ALC is dropping a little upon tune-up. The power drops some also....about 10 watts on CW. A while ago while tuning up I noticed that the ALC dropped to nothing and the power dropped off substantially. This has only happened once or twice to this degree. This is all happening when tuning into a dummy load by the way. Could this be finals getting reaady to go? Your input will be greatly appreciated!

God Bless & 73,
Mike ab8pk

Bob;
I had a no ship on qth.com a couple of years ago. Tracked down him by
his call and called his local sherriff. Asked for a detective and low and
behold he knew he was as soon as I mentioned his name. Had a money order
for my $150 back in my hands within a week. Seems local autorities take dim
view on getting calls about locals. Don't know what would happen
internationally but certainally worth a try.
By a non-spelling ham :)

My old faithful TS-820S has thrown me another curve.

I lowered the DRIVE while on 40M to create a QRP transmission. When I tried to go back to full power, the meter did not register any DRIVE, nor output. The antenna tuner shower no output indication nor VSWR.

After turning the rig off, once again tried to establish full power condx on 40 meters with no luck.

I now have the case off, the 6146 cover off and am ready to operate. Is there a Doctor in the house?

Put that final cover back on before you get hurt! hi
hi

Question: what does the ALC indication look like, in
TUNE mode, on 40m, at full carrier setting?

What does the plate current look like in TUNE mode, NO
carrier, and then in SSB mode, no modulation?

Is the SG switch in back in the ON position? (check
this first).

Finals usually don't fail without some sort of smoke
signal.

Caution is a good word, but so is patience.

I mainly sell on ebay, rarely buy anything. Since
9/11 I have noticed that postal service over the
border, either direction, has gotten very spotty. So
far this year, the fastest I've seen anything move
from the US to Canada is four weeks, and I'm told that
going the other way is slower. I'm quite OK to wait,
if it means the potential of better security, and more
X-Ray type inspections.

A single drop of 10W-30 motor oil should float the
dirt to the outskirts of the planetary ball run..
there you should be able to remove it with FOAM tipped
applicators. Don't use "q-tips", the cotton strings
will get left behind.

Allen;
I hear where you are coming from on price on that cable. I gave my first born for mine. Although the vfo plugs in, remember that it also gets the power from the 830. That's why you never loose your memory. It (the vfo) will also go goofy on occassion because of that. Only fix is to unplug BOTH the vfo and the vfo cable for about 10 minutes. The pins are very hard to wire and my advice is pay once up front and be done with it. I've seen only one ever go bad and that was mine! (broken wire in the cable).

Alex,

I bought one off e-Ham about three months ago for $225 including a D-104 microphone. It was 8.5/10 cosmetics and 9+ electronically. Only thing wrong was the lamps over the S-meter and that was just $2 in parts and 3 hours of swearing to fix.

I have seen them recently, represented in good condition, from a low of $200 up to silly prices. I think $200-250 is a decent price in good condition with no extras. If this one has transmit problems, you need to adjust accordingly.

606. It Begins... (TS-520s)

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-07-31 23:14:21 UTC
From: ab0tj
Topic: 606 Message: 606

OK Guys, I finally pried the 520s loose from it's former owner. I fired it up and here is a more exact description of the problem.

Tubes bias fine, HV supply is fine. Rig receives fine. But, when I flip it into Tune mode I can't get any ALC or IP reading. In USB mode, I got a tiny bit of RF out by blowing HARD into the mic. I can hear myself just fine thru the monitor circuit. The signal sounds fine on a nearby rig.

So, here's my (very non-expert) analysis. Everything is fine with the rig, but there is something wrong with the circuit that runs the tune mode. The only thing that bothers me about this idea is, shouldn't I be getting more power out than that even if the rig isn't tuned right? It's not even putting out one watt.

Any help would be appreciated. I will rip open the rig tonight and see if I can find anything. I also have the service manual so I will see if I can gain any insight from that.

73 and thanks in advance,
Alex AB0TJ

I purchased one of the connectors at Pacific Coast Parts 1-800-421-5080.

Stock Number KE-05-0901-05 (TS-820 9P VFO P) at $5.04 each plus $4.95 shipping and handling. ouch!!

I don't have a source for the cable. Probably an 8 conductor mic cable with one shielded wire will be fine.

I'll look for the pin out info and get back to you. Last resort I can open my cable. Try the internet for info.

What does it do in CW mode? I suppose your carrier
control is all the way up.

Make sure the SG switch in the back is ON. This will
switch the final screen voltage from plus 220 to minus
120 and that shuts the PA down.

You may have also lost the screen voltage to the
tubes. In USB transmit, measure from the tube screens
on pin 3 of each tube, back through the 100 ohm
resistors that are soldered to the tube base pins.

If the tube screen V is ok, and PA bias current can be
run up past about 150 mils with the BIAS control, then
you may have either a bad driver tube or bad driver
tube plate or screen supply.

Whoops fat fingerd the TX button on that last one:

BTW the SG switch is a great "grandkids" switch... you
can let them play with the rig, without transmitting.
Also at FD or other "field" situation, the SG switch
can save you from a melt down if the PTT button gets
switched on accidently.

You can also turn it into a QRP (with lower screen V)
or a QRO switch if you want.

I would like to have screen voltage controlled via a
pot if I had one of these rigs...

Bob,

Thanks for the info on the 9P lug, but the one I am really curious about is the other end! Where it attaches to the R-820, the connector is rectangular in shape with two rows of holes. It sort of looks like a cross between an RS-232 female and a Centronics parallel.

Each row has a set of six holes, a small gap, then three more for a total of 18 total. The holes in the connector are elongated (maybe I should call them slots) and are set on a 45 degree angle. The end of the connector housing has a notch at each end similar to a parallel printer port, presumably to receive a spring clip that holds the cable connector in place.

If it helps, I can make a digital photo and upload it to the group. Does anybody know what this is?

73,
Jim

In CW mode it's the same, a signal but nothing that would make it thru the coax.

Yep, SG switch is on. Would that be the easiest way to check if there is screen voltage, by tweaking the bias to see if it would go over 150?

Not sure if my DMM would hold up to testing that voltage directly, would it be AC or DC? My DMM says it will do 1000VDC/750VAC MAX. If I remeber right, the tubes get 900v?

Thanks,
Alex

PS- Still need to crack open the service manual here. It's been a long night. Time for bed. At least I opened up the rig finally.

Alex, stay off the plate voltage, hi! You can assume
that if the rig is on, it's there. Plus I think you
can check it with the meter on the rig in TX.

Yes, if plate idle current goes to 150ma plus, you
have good screen supply. I like to see at least 150,
prefer to see 175.

Bingo! IP will only go upto about 140 while idling. So, I'm not
getiing screen voltage somewhere?

Thanks,
Alex

622. R-820 Connector

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-08-01 22:36:03 UTC
From: Jim
Topic: 622 Message: 622

For those kind folks trying to help me figure out what connector I need, I have uploaded a digital photo of the beast to the Photos Section of this site.

73,
Jim

623. Re: [TS-520_820_530_830] Re: It Begins... (TS-520s)

If the screen voltage goes away you would have NO idle
current.

Make sure you know where the plate hi voltage is under
the rig before you start measuring the screen voltage.

I am thinking you have a combination of worn out
finals, driver and alignment issues.

From: pulsepairing
Topic: 622 Message: 624

The connector that mates with that is a Hirose Electric P-1316-CTA.
The other end of the interconnect cable is a 9 pin male circular
connector like those used on small tubes.

Here's how the TS-820 to R-820 interconnect cable is assembled
("tube" connector pins are numbered clockwise, looking at male
(cable) connector)--

Tube Hirose
----- -------
1 1 (coax signal)
2 9 (coax shield)
3 14
4 --
5 4
6 11
7 6
8 12
9 13

For standalone operation of the TS-820, there's a plug in shorting
connector that connects pins 8 and 9 (again, on the male connector as
indicated above).

Theo,

I don't know where you came up with this info, but I really
appreciate it!!! I assume I use a piece of thin coax for the RF
portion and any standard 6 conductor copper cable for the rest?

73,
Jim

Hmm... So, new tubes throughout and an alignment?

Strange, I have idle current in USB but not Tune. Probably more than tubes/alignment, I'd think (?).

Thanks again,
ALex

Also, in CW mode, it puts out a signal that shows up as S9+40 in my other rig, but in tune, no IP reading, but an S7 signal in the other rig. I'm assuming that's just because tune is supposed to have less power out. The point is, some signal is coming out either way.

Thanks,
Alex

Yes, tubes.

TUNE mode reduces the screen voltage to save the tubes
in case of a problem... should be no idle current.

b

I'll see if I can find someone with a tube tester and check that out.

630. narrow ssb mod for Kenwood 820s

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-08-03 14:40:35 UTC
From: David A. Echols
Topic: 630 Message: 630

Does anyone know of a ssb filter mod for a Kenwood 820s ... I'd like to make mine much more narrow. 73's David

631. 830s power level & other questions from a newbie

Yahoo group: TS-520_820_530_830 (2001 — 2004)

From a newbie

I have an 830s which is running fine, but now that I'm getting more acquainted with it I have some questions. One is, how do I lower the power if I need to? The manual only seems to give information on peaking it. I notice that the carrier control seems to do this, but I'm not sure that's the way it should go.

Is there a "QRP setting" for this rig?

Last (for now), how is bandwidth set on this machine?

Thanks for the help,

Scott

Scott;
To reduce pwr detent the "load control". There is no QRP setting. Your bandwith can be set using both the notch control and IF shift. If you add the optional filters you can further the narrow the band with. I suggest that you only use the 500khz filters as the 270khz can cause excessive ringing. You can use both the 8.3 and 455 filters at the same time. Or cascade them. The INRC filters seem to be a better filter over the KW, but are a little more expensive.

After a bit of fooling around with the rig (receiving and trying TX every once-and-awhile), the power out on CW is now up to 2 watts and the idle current can go all the way up to 160. Does this mean anything other than it's just been stored too long?

Thanks and 73,
Alex

634. Coax specs

Yahoo group: TS-520_820_530_830 (2001 — 2004)

Thanks to Theo, I have managed to locate the connector I need to fabricate a transceive cable to connect my TS-820 and my R-820. It looks like eight of the pins on the VFO socket are used, one blank.

Two of the pins are for the signal and related shield. Is there a certain type of coax I should use for this (or avoid)? How about the other six conductors? If I am looking at the schematic correctly, the other six are all switch connections so I would think any decent quality copper wire would do.

73,
Jim

David,

I just got one from VECTRONICS that has four different settings. It is a kit and I am not done with it yet, only $19.95 plus shipping. Not hard to put together either. I will let you know if it works when I finish it. I should have it done in the next couple of days.

Glad to help, Jim. The original interconnect cable is
labelled "Shinko Densen 1977" and is just an unshielded bundle of 20
gauge wires, together with that piece of thin coax. I don't know its
impedance. --Theo

Tx bandwidth is set via the 8.8Mhz filter BW, same as
on receive.

no QRP setting unless you want to mess with the screen
voltage taps to the SG switch on the back.

The SG switch when OFF switches the PA screens to the
negative bias supply of -105 volts, shutting off the
tubes for transverter use. You can re-wire that to
about 50-60 volts, obtained via voltage divider
network, to reduce power. Not a trivial task.

another way is to inject a 0-9 volt negative voltage
on the ALC connection in the back from a 9v battery
and pot; I have not tried this.

Enjoy the 830, they are still great rigs!

hi,

http://www.mods.dk/ has an external
mod for ts-520 qrp.

I use this on my ts-530 - 6v to pin 6 on din
and + 6v to ground. (and on my 520 too !)

great for psk31, sstv and tentec transveters.

What concerns me re: ebay & radio gear is that it
seems relatively few of the sellers are hams.

I've seen a number of items that appear to be junk
going for very inflated prices.

Personally, I prefer to buy from either other members
of my listgroups, or ham owned/operated classifieds.

Just my $.02

As always, caveat emptor.

I agree, the prices on e-bay are sometimes crazy. But, on the other hand. When you set your stuff out at a hamfest, so many make crazy offers on equipment! "I'll give you $50 for that 520, it has a knick on the cover!" Yea, right! I just put a Fox tango filter for an TS820 on E-bay because I want to get the most for it! If I took it to a free flea or hamfest I would never get anything for it. E-bay has it's place in todays amateur radio world. I think thats why hamfests are hurting and not able to be what they were just 10 years ago. I'm really sorry to see that. I like going to just meet other hams, the forums and of course pick up that $50 TS-820 with the scrach on the top! Hi Hi and

Anyone have a picture that they would like to see posted on our group "splash" page?

Can be any of our four models that we cover.

Send to me direct (group won't allow attachments).

Please, no obvious shock or fire hazard pics.. some of our members are highly impressionable! hi.

Thanks!

Ya... agree.

But, when I need a filter or tube or whatever like
NOW, can't wait for hamfest... ebay is still best.

Had guy wanting an AM filter for his 430... was going
to pay IRC for one, ended up paying me a bit more than
half and that was after my mark-up! So it definitely
has it's place.

Always remember, ebay is capitalism at work; supply
and demand... Prices are high because people want that
item. Barring high reserves and other such things,
what you see a radio go for is the EQUILIBRIUM
price... that is, the amount was exactly at that point
where the UTILITY of the buyer's money was exceeded by
the UTILITY of the item... then the trade happened.

Ever see the movie, A Beautiful Mind?

652. Re: [TS-520_820_530_830] TS- 830 Filter caps

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-08-06 22:08:59 UTC
From: Jim Wilson
Topic: 599 Message: 652

The original 100 mfd, filter capacitors in the TS-830 are 1.375 D x 2.3.75
H. The best replacement that I have found is a Mallory computer grade
capacitor that is 1.375 D x 2.125 H. It has screw terminals and an
insulated case and can use the original mounting clamp.
It is Mallory p.n. CGS101T450R2C, Mouser p.n. 539-CGS450V100.

I found other 100x450v by brands that I am unfamiliar with, but have
trusted the Mallory for many,many years. Also the dimensions are in its favor.
I measure about 470v unloaded, but hope that being "computer grade" the
peak 525v rating will be adequate.

Hope this helps those in need,

Jim, W%MHL

C90-0327-05 DIGIKEY P7453-ND MAIN C18, C19 2
CAPACITOR, ELEC 150uF 500WV RADIAL 62.5x36mm
2-23/64"x1-29/64

You can also use these from Digikey; they have solder
tabs and are very short! Scary at first to see these
little things in there but they do work fine. The
diameter is the same as stock caps.

Hello all,

Please forgive the cross-posting.

Sorry for the late notice, but I just heard about this
event.

There is a VE Exam/Hamfest/Swap Meet tomorrow, 08/09,
at Anderson River Park in Anderson, CA. Anderson is
located about 10 miles south of Redding off I-5.

For details, go to www.qsl.net/arca

I'm not a member of either club involved, but as I
live only two miles from the event, as wasn't aware of
it until now, I just thought that I'd spread the word

658. TS-820S TX freq trouble

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-08-11 11:17:52 UTC
From: robjaw1
Topic: 658 Message: 658

Started on me last night, when in rcv, say 7.2610, everything seems fine, then when going to transmit the VFO jumps to 7.2613. Same thing happens with External VFO, getting a slight jump in output freq. Im sure this has to be a simple adjustment of something, but where to start?

Thanks
Rob

Howdy, I'm just wondering what the difference between the 820 and the 830 is.(I have an 820) Can I download and use the service manual for the 830s, or is there too much difference? Or will it cover the earlier model(with references)? Thanks.

660. Re: [TS-520_820_530_830] difference between standard and 'S' designation

DAy and night. Apples and oranges. Shitzus (sp?) and
Shepards. You get the idea..

Find svc man for the 820, search ebay "kenwood service
ts*" or something like that.

My opinion: the 830 is the better rig, from
servicability and reliability standpoints. Also
performance, the 830 had better IF unit, quieter
VFO/PLL system, and of course, smaller footprint.

Hello Dave,
why so complicate? Download the manual from
www.mods.dk

you will find both for the 820 and for the 830..
there are too much differences between the 2 models... so use the rught service manual

you will need to look at the RIT/XIT circuits, make
sure that you are not getting a DC shift on these when
RIT/XIT is OFF. Also the front panel switches may be
intermittant; jiggling them may cause the problem to
change.

Take covers off and reproduce the problem, then gently
push on all the wiring harnesses and connectors
between the signal boards (stay away from the power
supply, please! hi)... also, tap on the T/R relays..
these also control T/R voltages and may have an
effect.

Disconnect ur external vfo from the rig, and unplug the vfo from the 110
plug. Wait about 10 minutes and reconnect and your problem should be solved
This is not an uncommon problem and is even doc'ed in the VFO-230 manual.

Make sure that your rit is not nudged a little. So when you
transmit that is the real frequency.

The rit was off on both the TS820 and the external VFO,
The transmit freq went up when either I tried using the internal
or the external VFO.

I will try to uplug everything and disconnect when I get home
and then wait 10 and try everything again on it.
Will let everyone know what happens... Hope that does the trick!

Thanks!

OK, I unpluged the vfo cable, removed ac, waited 10, set everything back up, now on LSB, works fine, with or without the external VFO, now though... When I goto CW, and tune up or whatever I notice that I move up the band by 800hz. Rit is off, I can either have the external VFO plugged in, or I can put the jumper plug in, same thing. If I have RCV set at 7.2610, I goto CW, and move to send, I now have 7.2618. Is there something I am missing on this unit? Im new at this so PLEASE bear with me! LSB and USB seem to be working fine now, but the CW doesnt seem quite right to me now.It might have always been like that and I just never noticed until I started actually using the radio..... I hope it is just me and not something to the radio......

Thanks!

669. While we are on the subject of the TS820S

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-08-11 22:18:56 UTC
From: robjaw1
Topic: 669 Message: 669

I went over all the tuning procedures, have the antenna set properly with my AT-200 showing 1.2 swr, now my question is can I really expect to be putting out 200watts PEP on LSB, and will this unit put out 160 on CW, because the meter is telling me that I am only putting out 110 to 120 watts. I know the tubes are good, I had checked them when I first bought the rcvr.

Thanks
Rob

800 hz offset on CW tx is normal. The 820 shows the
TX shift; newer rigs do not, even though it still
happens.

When you tune a CW station so that they give a 800hz
tone and you were to transmit without a CWT offset,
you would be zero beat to them (ie 800hz off) and they
would not hear you. The offset is necessary so that
your signal is lined up with theirs. PS if you tune a
guy on CW so that their "note" in your speaker matches
the tone of your own CW sidetone (hint; tap the key
once), you will be "zero beat" to them, with your 800
hz offset; they will have much better chance of
hearing you, even with narrow filters on their end.

Sorry Bill!
Your answer explained it to me, and I REALLY do appreciate that!
I was just happy that it wasnt my radio, just me!
And that dave just told me to uplug everything and not have to open
that radio up!

I Hope when I hit the net tonight, I will have it right this time!

Thanks Bill!!

The 820 was rated in plate INPUT power. The difference
you see is because most 820's show an efficiency
(output to input) of 65-70 percent max.

100-125 is to be expected, less on ten meters unless
you have fresh finals, and 120vac line

You are welcome. Yes Dave and the group really do
care about you and your enjoyment and understanding of
your "new" rig.

The older tube radios are just a bit different than
the solid state rigs, and take a bit more skill to
tune up and operate. Cool, huh?

Wait til you try Drake twins or Collins set up... or a
Heathkit Marauder and matching receiver; so many
knobs, you could spend all night just tuning up! har

ps what net: when, where?

You are right Bill,
I looked at some of the newer rigs, and couldnt
bring myself to spending that much money for a bunch
of stuff I am never going to use, besides, I like tubes! :-)
Helps to keep the "shack" a little warmer also.

I have just started to listen and talk with the 1721 group
on 7.2610 during the evening hours. They have quite a few
people checking in there. Very nice group of people!

It will take me awhile to figure everything out on the TS820S,
but I think it is one cool looking radio, and seems to me it sounds
quite good. I think I am getting the hang of tuning it in now.

I also want to start working on a TS700SP I bought and see if I can
get that going, seems it just needs a good cleaning out and maybe
some no-ox on the connectors, and the VFO is a little skidish, but
sounds good. I am almost ready to give up on that FT-227 I have, I
cant seem to get pased zero on its display, that might be a cold
winter project....

Thanks for a great group.
Rob

676. No VOX/Semi Breakin or CW side tone on TS-830

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-08-12 12:42:40 UTC
From: mallisette
Topic: 676 Message: 676

Hi Kenwood fans,

I have recently sold my TS830 (owned since new - Feb 1981) to my brother GU4CHY. He bought it with a known fault on the understanding that I'd help to fix it.

The fault is as per the subject. It occurred during a CW QSO a few years ago, as I remember the sidetone slowly faded away and after that no semi breakin on CW or VOX on SSB.

I had always hoped to get it fixed, but having a foot switch wired to the PTT and other radios in the shack has meant it's never been done. Also being rather adverse to wire wrap joints didn't help either!

One good thing about selling to someone you know is that you get a chance to visit a pre-owned classic in it's retirement home!

PS Had a TS820 before the 830 and that's still around on the Island too!

Any help appreaciated.

Mike I think you are going to find a bad transistor in
the sidetone oscillator section.

678. Is this a design feature or ???

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-08-12 14:56:56 UTC
From: Jim
Topic: 678 Message: 678

As some of you may know, I had to trade my trusty TS820 to a guy that had the rare R820, but wanted a new toy to play with instead of cash. So, it was off to hamfest land this past weekend where I located a cosmetically pristine example of the TS-820S to replace it.

This one looks a bit different in the back than what I remember, so I assume it is a somewhat newer model. I put it on the air last night and it seems to work just fine, but when I power it up the digital display acts a bit strange. As the tubes were heating, it displayed a single digit on the readout (a 4 as I recall), but seconds later it flipped into the full display and operated as I would expect.

Is this a failure waiting to happen or a "feature" of the later model? I know some of these rigs need the connectors cleaned and since I have to do some minor wiring mods to get it to transceive with the R-820 I will have a chance to do that. It there anything else I need to check while I have the case open?

73,
Jim

First thing, always check your VCO loop or lock
voltage as the problem is occurring; also the
connectors along the front edge of the VCO/PLL unit
may be loose.

Thanks Bill, I'll take a look.

By the way found lots of 830 info here
http://www.geocities.com/om6523/

Perhaps with the authors permission we could put a copy of the
document in the files section.

Hi Mike, looks like a pretty good resource. He has
already given permission to distribute over the 'net,
as long as corrections and additions are mailed back
to him.

Would you mind putting his site in our LINKS section,
and also downloading his two documents to our FILES
section?

Thanks!

Hi Bill,

If you remember, I posted those files in the Files area a few months ago...

686. Need on advice on broken TS-530 PA

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-08-12 19:50:33 UTC
From: Greg Milligan
Topic: 686 Message: 686

Could some one help shed any light where I should look next to solve the problem of reduced power on a TS-530S.

At some point I had a small pop and a little smoke, nothing huge like a big capacitor going off (well as far as I know). The output power reduced to approx 50W out and HV showed approx 450V on TX (was normaly around 900V). So tended to suspect valve failure, and popped the lid open to take a look. Note: mains supply runs at 240V AC

No burnt components found so far.

These are the things I have tried so far are...

Driver valve appears OK, tried it in my TS-830S (in fact better than the stock TS-830S - reminder to self to replace 830's driver as its going soft - its ALC is dropping off over time!)

I have also tried the TS-830S PA valves in TS-530S which produces same the result, so not the PA bottles either. Therefore original TS-530S valves were put back in place.

R2/R3/R4/R5 resistors on the PA board all lifted up and independantly measured approx 22 ohms each. Typically 6 ohms when all in circuit (22/4 = 5.5 ohms) so all ok there.

The screen voltage resistors R7 and R8 all check out at 100 ohms each, so does R1 (100 ohms)

Plate idling current can be adjusted up to 200mA via rear bias control Currently set at 60mA.

Screen voltage measured on pin 3 of each valve (via R7 / R8) is
when SG = on 257V (rx) 242V (tx)
when SG = off -115V (rx) -111V (tx)

Checked 800V DC supply from rectifier unit
when SG = on 755V (rx) 420V (tx) <---- problem
when SG = off 764V (rx) 764V (tx)

Looked on scope the 800V supply seems OK on rx (smoothing could be a tad better thou), but the supply appears to half wave rectifying on TX hence 420 V. At this point I would suspect one of the PA valves circuits to be failing, as these are switched "out" when the negative supply is supplied to the bottles.

R11 = 470 ohms on the rectifier board appears OK.

I am not quite sure what I should be expecting from the PS1 / PS2 resistor come coil arrangements on each of the PA plate connections they both seem to be short circuited when measuring resistance across each of them.

Both heaters seem to light up.

I am running out of ideas what to try next. Any ideas or suggestions out there?

Thank you.

You lost a HV filter cap, no big deal.

I have replacements for these, or you can get them
from digikey I think... I will get you the part
numbers if you want, there have also been several
posts lately on other cap sources.

Plan on replacing both caps.

When these caps fail, they often leave the rig in
operable condition albeit at lower plate V and 1/4-1/2
power out.

This is because they are in a voltage doubler; as soon
as they fail, they take themselves out of the circuit,
then you are running on just one side of the system.

Bill,

Thank you very much for the quick response. This is very good news to hear, I have spend several evenings on this and have rather enjoyed fault finding this (till the point I became well and truely stuck!).So far I have learnt an incredible amount on how this radio actually works.

I've checked your previous email on the subject of filter caps I persume it mean the following items from digikey?

C90-0327-05 DIGIKEY P7453-ND MAIN C18, C19 2
CAPACITOR, ELEC 150uF 500WV RADIAL 62.5x36mm
2-23/64"x1-29/64

I haven't purchased from this company before, although I noticed that they may have a UK outlet via their web site (which is great news for my other projects)

I know that the stock ones are 100uF and are labelled C22 and C24, I persume the ones mentioned above were for a different revision or model of radio? I noted that they were the same kenwood product code. Will 150uF ones wont make too much of a difference, large voltage generated, when compared to 100uF?

I persume the capacitors would act as a pull and push voltage doubler to generate the higher voltage? I am right that the resistor across each of them would act as a form current limiting?

Looks like I need to read up and revise on voltage doublers as I am not sure how the circuit protects itself if a capacitor ever short circuited. I persume the cap in my case has gone open circuit.

Thanks for the advice.

Greg

Let everything discharge and I think you will find
that the cap is actually shorted, or very low value
resistance! That is one of the characteristics of the
Kenwood power supplies; they don't carbonize the rest
of the radio when they fail.

The 470K resistors are bleeders and do tend to balance
the voltage on the caps so one doesn't get it all

Yes, the digikey parts are right. They don't look
right once you put them in... they are way too short
to work!! hi hi

150 vs 100uF makes little difference, you may have a
bit less ripple on CW tune, but no one will notice.

690. new to group de KF3KWO

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-08-12 21:24:43 UTC
From: Jeff, Julie, Annabelle, and Nicholas
Topic: 690 Message: 690

Greetings all, my name is Jeff Nyberg, KF3KWO. I live in Odenton, MD, and am active on 2m/440, plus HF. The reason I joined this group is because my father-in-law just gave me his old Kenwood TS-520SE. My HF experience so far has been limited to 10m, using the HTX-10. I recently upgraded to General, so I'm looking forward to getting on the other HF bands with the 520SE. I'll be putting together the station in the upcoming weeks - ie buying a tuner, making a new dipole, etc.

73 to all,

Jeff

Bill,

Thanks for the advice. All noted on the bleeder resistor and the supply ripple.

I have ordered half a dozen of these capacitors from digikey, two for this set and the rest for spares in case I have the same problem in my other Kenwood. I intend to run these radios for many more years to come, so I am stocking up on a few spare parts. However the price to ship the capacitors to the UK was a little alarming, but well worth it in the end.

When they arrive I'll let you know the outcome. I liked your comment regarding 'they dont carbonize the rest to the radio'. Overall I am very impressed with my TS-830S and TS-530S, its a shame newer models are not designed with this care and attention in mind.

692. Re: [TS-520_820_530_830] Need on advice on broken TS-530 PA

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-08-13 17:18:39 UTC
From: Bill
Topic: 686 Message: 692

Actually, some radios are so designed.

I had a TS-950S (not DX) in for new finals. Lightning
had damaged the old ones. I expected to open it up
and give the owner the bad/good news that he should
file a claim for a "totalled" radio. Instead, I found
that the finals were gone indeed, as was a 6 amp
fast-blow fuse on the PA board. And THAT WAS ALL the
damage there was! I was truly amazed.

Later I had a FT-1000D come in, again a lightning hit;
All it lost was a PIN switching diode on the filter
unit! TOUGH...

Compare to the Kenwood TL-922 that destroys the plate
and grid current meter movements, the cathode bias
zener and a couple of other parts whenever the
3-500Z's short grid-to-cathode.. oh well, ya can't win
'em all!

73,

Bill

three minutes is good.

Turn on rig, get cup of coffee.

696. best tuner for ts-520SE

Yahoo group: TS-520_820_530_830 (2001 — 2004)

What would be the best and INEXPENSIVE tuner for my ts-520SE? I
would like to operate SSB with a flattop dipole on 40 through 10.
Thanks for your help!

Since the both of these rigs have (4) crystal controlled "Channels"
and the math to get the frequency you want is established, can the
820 & 520 be operated on the new 60 meters channels?

Nope.

The xtals are to be used to replace the VFO on a
particular, existing Band.

Since the 820 has PLL you could mod it but it would be
more work than it's worth, I think

for the 520 you would need a het crystal for 60m, and
you would have to rip off 80M for it... not cool
either, in my book.

Any good-looking USED kw tuner off Ebay will do it.

Stay away from the mighty fine junque 100w models.
When tuning a dipole to other bands, de-rate the tuner
rating in watts by a factor of ten!

Jeff;
I have found the MFJ 962C to be a fairly good tuner for the money. I will handle a amplifier if you ever choose to add one. I do suggest getting the 962D with the roller inductor though. The smaller units just don't provide the variables you will need to operate that antenna. You might also consider the Heath 2040 unit although it might be priced higher because they are not as common. Check out the tuner reviews on eHam.com before buying. Go place to look is QTH.com but not the only place. Good Luck (some of the other guys may have some good suggestions also)
Dale K9TTT

Subject: [TS-520_820_530_830] best tuner for ts-520SE

What would be the best and INEXPENSIVE tuner for my ts-520SE? I would like to operate SSB with a flattop dipole on 40 through 10. Thanks for your help!

Dale and Bill,

Thanks for your hints regarding the tuner. I'll follow y'all's advice, as well as any other. My biggest fear with operating the 520SE is that I don't have any experience operating a radio with tubes. I have received the owner's manual now, and can follow the procedure just fine. I plan to tune up tonight and try out 10m with my existing dipole. I just hope I do it right. Of course I'll follow the instructions to the letter, but it's the whole "tube" thing that is providing a challenge for me. A little bit intimidating, I guess you could say.

Thanks again and 73,

Jeff, KF3KWO

Hey Jeff...

Read your post on being intimidated by tubes...

Not to worry... just think of them as "Hot Wire FETS"... work the same way with higher voltages... hehe... Hot wire for the filaments...

Good luck,

Raleigh
NY0Y

Jeff,

While it may be overkill for what you need now, I went ahead and got an MFJ989C which is the 3KW unit. I found it used on e-Ham for $150 and it comes with a large, backlit cross needle tuner and a built-in dummy that can take a lot of power (not that you should tune up for hours on end). If you have a bare bones shack like I did, it might be cheaper to get a used higher end unit with all the things you will ultimately wind up buying, especially when you factor in postage and handling for separate items. The 989 also has the roller inductor and can tune damn near anything.

73,
Jim

For what it's worth Jeff, I use a MFJ 941D. It works on the homebrew vertical.
Just might want to consider a separate SWR Meter though. Really backs up and gives you a better picture of what's happening.

Just go through the book tuneup procedure a couple of
times.

Main thing, is get that plate circuit resonated as
quick as you can; once you do that you can relax a
little.

The tubes are pretty tough but there are limits.

You should be able to tune the rig into a dummy load
in about 5 seconds total transmit time with practice;
then, reduce power and setup the tuner. That will
actually take longer, than tuning the rig!

Your radio will handle up to a 3:1 swr by itself; no
need to use the tuner on the band that the antenna is
cut for. That should simplify things.

Jeff;
Bill's right...those tubes will take quite a beating, but that's not the idea hi hi. Had an 830s that would run almost anything EXCEPT a non-resonant 160 antenna! Blew the tuner, the finals, the diode protections to the finals, and of course the internal fuse hi hi. Don't do door knobs or screendoors and you'll be alright! You ll have a blast with that rig!

I use a M F J 900 I bought on e-bay for $20. Works good. Any of the small MFJ tuners will work the 900, the 901 and the 902. All quite inexpensive.

Jeff

I,m running a ts530s into a windom that doesn't tune very flat and I have hade no problems so far. I just built a dipole for 10meters and with a little tuning I got it to flat,so I don't even use the tuner when I hook up this antenna. Not much on ten. I've had a few QSO's.
Good luck, and study that operators manual. Hope to hear you on the air.

Thanks again everyone for the hints. Here's my next quandry:

Read and reread the tuning procedure. Followed the steps, did the adjustments, everything seemed to be reading just fine on the meter and its different settings, but when keying the mike (MC-50), nothing. I hear the clicking inside the transceiver, but no response on the meter, and no signal overheard on my shortwave. Tuning up did generate some RF (my stereo went mute while doing so), but nothing when keying the mike. Checked the troubleshooting hints in the back of the manual, and it seems that I may have a bad microphone.

Have I made sense at all?

Doing the tuning up this morning really helped me understand everything that goes on with tuning up a tube radio. Voltage, mA, et al...quickly becoming lingua franca in my station.

73,
Jeff, KF3KWO

Double check that your MC-50 is set for high impedance instead of low.
There is a red dot on the cable connector from the base to the microphone,
make sure it is on the same side as the red "H" on the microphone itself.
Also make sure that the red dot on the radio to base connector is on the
same side as the red dot on the base side, if that one is backwards the PTT
will function but no signal can pass to the radio.

Get a ARRL handbook from about 1957-1969, then read up on tube circuits. You will find it very interesting. These handbooks can be had at hamfests and eBay for up to 25.00 depending on condition. You don't need the best condition because soon yours will be dogeared and coffee-stained! hi..

160 is tough with short antennas. You need broadcast duty stuff to tune anything shorter than 1/4 wave (132 feet, one side).

b

Dale Cole <k9ttt@...> wrote:
Jeff;
Bill's right...those tubes will take quite a beating, but that's not the idea hi hi. Had an 830s that would run almost anything EXCEPT a non-resonant 160 antenna! Blew the tuner, the finals, the diode protections to the finals, and of course the internal fuse hi hi. Don't do door knobs or screendoors and you'll be alright! You ll have a blast with that rig!

Bill,

Thanks for the hints. A lot of that is Greek to me, but I've gotten some reading material so I can try to understand these "new" terms. New for me, anyway. Never thought my first all-band rig would be 20 years old with tubes.

Jeff

Hi there,
my name is Klaus, G7RTI, QTH High Wycombe near London/UK.
Obtained a TS520 a few days ago and now using it mainly on 40m.
I normally work SSB QRP (5w) but find 40m quite difficult at the moment.
I have looked at the mod suggestions for turning down the power and will
do that at some time - But it's nice to get through a times - though even
100w isn't that easy ....
Anyway, I'll be monitoring the emails to see what other users do with the
TS520.

Klaus

723. Third Party Filters

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-08-26 01:28:35 UTC
From: Jim
Topic: 723 Message: 723

I need the CW filters for my R-820 and Kenwood Parts shows them as out of stock and discontinued. Has anybody had experience, good or bad, with third party filters such as International Radio?

Also, does anybody know the difference between the YG-88C 500Hz CW filter and the YG-455C 500Hz CW filter? Why the heck would they put two 500 Hz filters into the R-820? I can understand the 250 Hz, but why the extra 500 Hz? And yes, the manual shows slots for 4 filters (6K AM, two .5K CW and a .25K CW).

Finally, are the models with similar numbers interchangeable? For example, the YG-455CN is discontinued but there is a YG-455CN-1 available. Or is that too easy.

73,
Jim

>I need the CW filters for my R-820 and Kenwood Parts shows them as
>out of stock and discontinued. Has anybody had experience, good or
>bad, with third party filters such as International Radio?

I've had both InRad and Kenwood filters in my TS-440. The InRads had steeper rolloff skirts and a flatter bandpass than the Kenwoods. The result was better rejection just outside the cutoff frequencies and much less of a 'muted trumpet' sound on what was intended to pass through. The only drawback I had with them was that they were physically larger than the Kenwood filters which required some extra effort during installation (especially the SSB one.) This varies by radio model and InRad filter model, though. The other obvious advantage to the InRad filters is price and availability.

Please note that I'm not trying to imply that the Kenwood filters are junk, they most certainly are not. Just trying to set your mind at ease if you choose to go with the aftermarket filters.

>Also, does anybody know the difference between the YG-88C 500Hz CW
>filter and the YG-455C 500Hz CW filter? Why the heck would they put
>two 500 Hz filters into the R-820? I can understand the 250 Hz,
>but why the extra 500 Hz? And yes, the manual shows slots for 4
>filters (6K AM, two .5K CW and a .25K CW).

Different bandpass centers for different IF stages (8.8307 MHz vs 455 kHz.) Installing both would be redundant unless I am really misunderstanding something that the 820 is doing.

>Finally, are the models with similar numbers interchangeable? For
>example, the YG-455CN is discontinued but there is a YG-455CN-1
>available. Or is that too easy.

If it has the same center frequency, is pin for pin compatible, and physically fits one way or another there's no reason it couldn't be used. But that's probably not the answer you were looking for, hopefully someone else can answer with a definite yes or no.

725. Re: [TS-520_820_530_830] Third Party Filters

Jim;
The answer you suggest is way too easy. First the filters are not interchangable. One solders in and the other screws down. The difference in the 8 and 455 filters is that they react to the different stages of the IF. Someone please correct me if I am wrong.

Hi Jim,

I have both 500 Hz CW filters in my -830. They are the IRC vintage, and I had no problem following the directions to install them... BUT... as indicated in one of the other replies... They will "ring" when you cascade them, and are VERY VERY sharp... they also introduce some losses in the IF gain chain... (no free lunch)... When my rig was at Bill's place for some work, he installed a switch on the back so that I can select one or the other of the filters. With all the other control gizmos... (VBT, notch, PBT) one filter is plenty.... and it doesn't ring any more...

Good luck,

NYOY

The ringing can be fixed with proper tuning of the cans on either side of each filter... I have found that by carefully rocking the IF transformers on either side of a filter, while listening to a weak steady carrier, you can tweak for the best sound of the signal and basically eliminate the "ringing" effect. There can also be some ringing in the ears from using narrow filters (this is for real, I get it sometimes with certain room acoustics and speaker placement combinations)... try moving the station speaker, using a different speaker or (as in Raleigh's case) a wider filter setting.

I have trouble with high speed code on very narrow filters... cannot copy as well.

It will come back as we approach fall. This should be an OK winter on 10, peaking every 21 days with the solar flux... watch the numbers, and pick a freq to monitor.

I use a full wave loop, very quiet and dedicated antenna to an HTX-10 set to some commonly used frequencys, including the beacon channel at 28.200

Ask the moderator of that group if you are on "moderate" status... often that will delay posting until they approve it.

I use that tool for new members; cuts down on spamming of the group. Once I figure they are "ok", then I un-moderate them.

739. no ALC on 3.5 or 7

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-08-31 13:24:05 UTC
From: mamba000
Topic: 739 Message: 739

Hi All,

There's a bit of a story behind this one.....
are you all sitting comfortably??????????

OK. Bought this set (ts 520 not S or SE)from ebay as a non-working item, O/P stage burned up.

Further examination revealed that a previous repairer had replaced parts on the rectifier board, and had swopped the -120v line with the +300v line!!!!!!!!

I have rebuilt the o/p section and replaced the tubes, replaced all the burned resistors I could find along the -120v line, tested the driver tube, and fired up.

Receive seems ok now, as does transmit on all bands apart from 3.5 and 7MHz. There is no 1.8 on this early version.

I noticed that when in the 3.5 or 7 MHz bands, there is no ALC.

I can get 80-90 watts on all other bands.

I have netralized the output tubes.

Can anyone give me any clues as to where to look next?

This is a nice example of the early TS520 and it would be nice to restore it to it's former glory.

Best regards, Steve.

You are not set to "moderated" on this group; however, I have noticed that my posts to groups can take up to 4 hours to show up nonetheless. Depends on Yahoo traffic.

If I think I am having trouble with an account, I send mail to myself directly, from one account to the other; that shows me if there is a problem with my accounts or with the servers.

73,

Bill

ALC depends on the PA tubes drawing grid current on voice peaks (or on CW for that matter, with sufficient drive). That means the grids have to go positive on each cycle of RF, takes about 50-60 volts peak to peak to do that. May even be your ALC detect circuit half-out, or the blocking cap leaky, pulling the charge off the detector before it has a chance to act and give meter swing.

Closest I can get you to, is:

www.mods.dk

Go to the kenwood box - click on it - a screen will open up on the left side.
Go to Manuals.

I did not see anything for the TS-530S - but, the 520 and 830 were there.

The tubes should be dull red inside, like sunset!

On the back of the radio is a switch labeled "SG". It must be ON for the transmitter to work.

ALC depends on the PA tubes drawing grid current on voice peaks (or on CW for that matter, with sufficient drive). That means the grids have to go positive on each cycle of RF, takes about 50-60 volts peak to peak to do that. May even be your ALC detect circuit half-out, or the blocking cap leaky, pulling the charge off the detector before it has a chance to act and give meter swing.

mamba000 <steve@...> wrote:
Hi All,

There's a bit of a story behind this one.....
are you all sitting comfortably??????????

OK. Bought this set (ts 520 not S or SE)from ebay as a non-working item, O/P stage burned up.

Further examination revealed that a previous repairer had replaced parts on the rectifier board, and had swopped the -120v line with the +300v line!!!!!!!!

I have rebuilt the o/p section and replaced the tubes, replaced all the burned resistors I could find along the -120v line, tested the driver tube, and fired up.

Receive seems ok now, as does transmit on all bands apart from 3.5 and 7MHz. There is no 1.8 on this early version.

I noticed that when in the 3.5 or 7 MHz bands, there is no ALC.

I can get 80-90 watts on all other bands.

I have netralized the output tubes.

Can anyone give me any clues as to where to look next?

This is a nice example of the early TS520 and it would be nice to restore it to it's former glory.

Best regards, Steve.

Hi,
I am quite happy with my TS520, works well on 40 & 20m.
Higher Bands very quiet and 80m gives me TVI - still to
be addressed.
There is a regular trickle of TS520 items on ebay. The
one I am not really sure is the external VFO - why would
I use one? I am sure it's to do with the level of technology
available 25 years ago ...
Me I am of the "black box" generation ... hi !!
Thanks.

An external vfo allows you to work "Split" That is, you can transmit and receive on different frequencies. This is very important if you plan to work
rare dx or dx in general that frequently works split frequencies in order to manage the pileups that normally take place.

Hi,

Can you check the Mic Gain on the front panel ?

If you remove the mic and switch to CW and use a key
will the radio transmit ?

Mabye wire or bad solder connection in the mic plug.

Are you using Kenwood Microphone mc50 or other mic ?

From: DW
Topic: 757 Message: 757

I was just browsing through the manual for my TS-520,
and noticed that it specifically warns against random
wire antennas. As an apartment dweller, this severely
limits me, as a random is about the only way that I
can get onto HF.

Are they being overcautious, or is there really a
problem here? I would presume that after proper
tuning into a dummy load, and pre-tuning the random on
receive, that tuning into the wire shouldn't be a big
deal....or do I have cranial rectalitis again??

Thanks,

Hi DW...

As you probably remember from theory, each 1/4 wavelength of antenna has a minimum impedance point... at other places, like half waves, it is very high, perhaps a few thousand ohms... The problem is that your transmitter wants to see not more than 3:1 SWR... and also, random wires need an RF ground to work against.. But, all is not lost...

First get an antenna tuner between the rig and the random wire... Then, get as good a ground as is available...both for DC and RF... the RF ground can be a piece of wire 1/4 wave long run around the baseboard...(MFJ makes a tuner for ground wires like this)

If you do not do these kinds of things, you will end up with lots of RF in the shack, and on the phone and power lines... and the rig won't like it...

One last thing... the wire you run around the apartment will be hot with RF... you need to take precautions that the unwary or uninitiated do not contact this wire while you are transmitting... even as little as 25 watts can give a nasty RF burn, and there will be spots of very high voltage along the length of the random wire..... (voice of experience... burned a hole in the ball of my thumb, clear to the bone... 25 watts at 144 MHZ) For instance, to make the math easy, lets say your antenna exhibits an impedance, somewhere along its length of 1000 ohms, and you have put 100 watts into it... P=E2/R.... 100x1000=Esq... E = 1,000 volts of RF!!!!

And the wire will be hot and perhaps unshielded from the antenna connector out...

Having said all this, when I first set up in Ft. Worth some years ago, I used a setup much like you will have... and it worked OK... but I was cautious about things...

regards

Raleigh

Stick to tuned antennas for the 520... that means random wire, through a tuner, or dipoles and whatnot.

The 520 can handle up to 3:1 swr; however, if you feed even a resonant 1/4 wave wire on the design frequency, your radio will be hotter than a chili peppa for RF!!!

763. Should plate idle current be the same for all modes?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-09-07 16:57:19 UTC
From: Jim
Topic: 763 Message: 763

When I go through the tuning procedure for my TS-820S, I start by checking the IP. Normally, I am in USB mode when I do this and I have adjusted the bias pot in the rear of the rig to be spot on 600ma. Today I noticed that with the mode switch in CW, it draws a bit more than 600ma (more like 700-720 ma).

Is this normal or is there something I need to tweak inside?

73,
Jim

Jim, that should be 60mA, not 600.

Bias will go up and down with your line voltage; could be no one was cooking breakfast this morning on your block or something.

You can run as low as 30mA with no reportable distortion on your signal; give it a try and ask someone to check your bandwidth (make sure their noise blanker is off first!).

I run my tube amp much lower than the recommended bias with no complaints for that particular set of tubes, so far.

766. Connecting up a key

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-09-08 05:04:49 UTC
From: Grant McDuling
Topic: 766 Message: 766

G'day fellas,

I have just bought a great 520SE that came with the original manual, which says the CW key must be connected up using shielded wire. I have a stright key with two lugs on either side of the straight arm and one at the rear. I guess I connect the centre strand to the one lug and the shield to the other. But does the shield have to be earthed? If so, do I run a wire from the shield lug to the chassis of the rig (the earth nut)?

From: Mike
Topic: 766 Message: 767

The non-tip side of the key plug into the TS-520 is chassis grounded so you don't need to worry about grounding. The reason for the shielding is to keep any stray RF out of the rig that might be picked up by the key wiring. I personally use RG-174 to connect my straight key to any given rig and no problems yet. If your key has a post that is connected to the key base (ground) then connect the shield to that. If not, don't worry and just connect the key posts to whichever side of the cable.

Over 60 will increase plate dissipation, which is critical if you are running 6146A or 6146W with only 25 watts plate diss. ratings... not so critical with the 6146B at 35 watts plate.

0.030 amps per tube * 800v = 24 watts, with the A or W tubes, you are idling right at the tubes' max ratings. Which is OK unless you like PSK31 or long key-downs to tune up!

I like 0.020 amps per tube (40mA total), 0.020 * 800 = 16 watts per tube, much better.

As I said, most tubes will not cause distortion complaints until you get very near cutoff (0mA). If you only EVER run CW, you can actually reduce (increase?) your bias to 0mA and the radio is perfectly happy! Just don't run fone there... Class C is very efficient for CW but murder on fone sigs for distortion.

My SB-220 is supposed to run 220mA (0.11 * 2700v = 300w per tube dissipation; tube is rated at 500w, you are already 60 percent there. I removed one tube, then biased the remaining tube down to 60mA... I call it my class AB-C amp, hi... no complaint on distortion (work guys on USB, get 20 over 9 report, have them flip over to LSB, same freq, they report they can't hear my third-order products above the noise at S5). At 60mA and high plate voltage of 2700, the tube is idling at 162 watts, at low plate V of 2100 at 126 watts.. loafing.. power supply much happier also.

b

greenmoldydonuts <barcand@...> wrote:
...and what would be the purpose of running the bias at less than 60 ma? Just to conserve tube life? I am assuming that running it over 60 ma can cause distortion and shorten tube light right?

Only connect the cable to the key, shield to one term, center to other, straight to rig. No need to earth anything else.

b

Grant McDuling <grantmcduling@...> wrote:
G'day fellas,

I have just bought a great 520SE that came with the
original manual, which says the CW key must be
connected up using shielded wire. I have a stright key
with two lugs on either side of the straight arm and
one at the rear. I guess I connect the centre strand
to the one lug and the shield to the other. But does
the shield have to be earthed? If so, do I run a wire
from the shield lug to the chassis of the rig (the
earth nut)?

Rob;
This won't help you immediately, but keep your eye out for a product Kenwood made along time ago. I believe they were pn# MA48, 46, and 48 (I can't find my lit book). They were mic adaptors which would adapt 4 to 6, 6 to 8, 8 to 4, etc. They are kinda salty now because they are pretty rare, but I see them on eBay occasionally.

Hi,

Radio shack if you are in a hurry or

http://www.packetradio.com

This is the home of the Rascal interface and wealth of info on sstv, packet, etc.

Buck is good to do business with.

MJ-84 is kenwood adapter from 8 pin mic to 4 pin mice connector (female)
They are hard to find but you can make your own patch cord up if you want to.

I bought one at the Rat Shack, i plan on getting the rest from packet radio, he seems to have pretty good prices there. Yes, I am building an interface between the 820 and a pc so that I can get myself invovled in some of the digital communications and such. Figure Id give it a shot, cant hurt anything! :-) Found quite a few good ideas on line on several different interfaces, and plan on trying to incorporate several ideas into one. Thanks for all the references!

Topic: 781 Message: 783

The 2N6505 is obsolete. You will need the MCR-225/FP, which is not normally available from common sources.

Now you need to answer this question: Is the SCR bolted to the chassis, with an insulator and insulating bushing for the mounting tab, or is it on the regulator PC board (Astron does both methods).

If it's insulated and you want exact replacement, use the Teccor S2008R, Mouser Electronics 519-S2008R. This one has the tab connected to the anode, which is connected to the + side of your supply output. You can also order 519-S4008R or 519-S6008R which are just higher voltage ratings.

If you want to do away with the insulator, use the ISOLATED version of the SCR, which is the Teccor S2008L, Mouser number 519-S2008L. You can also order the 519-S4008L or the 519-S6008L which are just higher voltage ratings.

now... if you want to go heavy duty, use the 519-S2065J, which is a 65 amp job... it will not fail. If it does, you do NOT want to be in the same room! hi

I am cross-posting this to AMATEUR-REPAIRS group so it will be in the archives there also.

73 and good luck. If you need help getting these things let me know, I have an order going in soon.

Thanks for the info, I no longer have a cross referance that is current. From your numbers I found the part at Digi-Key and ordered it last night. I have an old RCA, SK cross reference, but don't know any place that sells the SK line of replacement parts. Again THANKS.

OK Gary.

I have the isolated and non-isolated ones coming, as well as the BEEFY one...

This is just an FYI for anyone looking to buy radios
and or antyhing else ham related on Ebay. I would warn
anyone NOT to buy from "plumrzbutt". I bought what I
thought was going to be a non DOA TS-430S unit and it
turned out to be nothing more then a door stop. When I
told him what had come to my doorstep he informed me
to bad sale done. I have reported him to Ebay, square
trade and so far neither has done NOTHING for me...
Now I am reporting him to my credit card company. Well
I might have been stuck with a piece of JUNK, but I am
for warning anyone else not to buy from this guy!
Sorry for taking up any bandwidth with trivial stuff,
but I thought I would try to at least make people
beware of this guy! You might be getting a deal, but
with this guy you could be getting nothing but junk
and he isnt going to stand behind it either!

Hi Bill,
I have good news!!!, I have find the manual for the TS-530 in line in PDF format, If some one need It try:http://www.cqham.ru/sch_eng.html , I would like to thanks all you for your help....I did check everything that I supose to check...but I still having the same problem, the ring don´t transmit, so I think that really it´s a final problem (may the tubes are bads, they light, but only a little)....any way..I will trying again.
Mr Stevenson I really apreciate a lot all your help, and count me in your friend´s list.
Finally, I am very happy to find this wonderfull group of people that love the radio and care about the others like all you did wih my problem

(again all you will have to excuse my English)

Bill,

Apologies for not getting back to you and the gang on the
TS-520_820_530_830 emailing list earlier.

I replaced the HV capacitors in my TS-530 as you suggested which were
sourced from DigiKey. These arrived in the UK quicker a lot quicker than
I expected. My TS-530 now works a treat. I had originaly photographed
the entire procedure to upload on to the net for others to follow, but I
had a recent hard drive failure on my computer and I am afraid I lost
the images !

But I would like to sy a big "Thank you" to you and the rest of the team
on the list for the advice. I am now back on the air with a big grin on
my face.

Cheers,

Greg

794. TS820S - Mods

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-09-29 19:27:22 UTC
From: robjaw1
Topic: 794 Message: 794

I downloaded all of the service items released by Kenwood for this radio and put the in the files section as a PDF file to make it easyer to download and print.

I have a question for eveyone out there,
without going out and buying a noise filter and or DSP unit, has anyone come up with a simple noise filter or notch filter mod for the TS820S?

Thanks
Rob

795. TS820S Question

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-09-29 20:54:49 UTC
From: Ken Nellis
Topic: 795 Message: 795

Hello all!

I'm new to the Group. I've been a ham since June, when I tested successfully for a Tech Plus license. Pleased to meet you.

I'm hoping you can help with a question: Sometimes when my TS-820S is in receive mode I can faintly hear what sounds like a relay clicking. This is accompanied by a slightly louder humming, on and off, as the relay cycles. It's a little annoying when I'm trying to copy a distant station. I don't hear it at all when transmitting, and it doesn't seem to be transmitting while the hum is louder.

I've fooled with the three Vox controls on the front and nothing I've done seems to make a lasting change.

Can anyone clue me in on what to do next? Thanks in advance.

All the best

Ken

Ken,
As long as the Vox/Man switch is on Man, the vox controls wont do anything. The humming leads me to beleive that it is a bad cap, but without more information, its kinda hard to make a stab in the dark guess......

The humming on receive will be caused by the larger, low voltage caps if they are in fact bad. You can use your DVM on AC scale to see how much hum you have on the caps.. should be less than 10 percent of the DC voltage they are running at, hopefully much less.

804. TS-520 Tuned into the ground?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-10-06 00:17:19 UTC
From: k9zy
Topic: 804 Message: 804

A number of months back, I decided to fine tune the output and receive on my 520. Output drive was at about 100 watts on every band except 160m which was at 75 watts, so I decided to try and fine tune to get it up to 100. I did not have the plastic allen wrench, so I used a metal wrench. I did not have a good dummy load, so I foolishly attempted the adjustments into a multi-band antenna, using low power.

After making several adjustments, as best I could following the instructions in the manual, drive on 10 meters was gone, 0!. I made more adjustments, and drive slowly disappeared on each band. All bands went to 0 watts output.

I thought I had blown the tubes, so I acquired new tubes (all 3), replaced them, and no change. Then someone suggested that the fine tuning was very delicate and without the right measuring equipment, I probably had put the whole system out of whack and that is why I had no output.

Does anyone have a clue what may have gone wrong, and how do I fix it? The only test equipment I have is a small multitester, but I do have a dummy load now.

Thanks,
Mark
K9ZY

OOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOO BOY!
Metal?
Sorry, had an out of body experiance there for a second!
Your gonna have to get some plastic, or non metalic
adjustment tools first!
Hope you didnt get to close to the VFO unit either and that
what ever you were using wasnt magnetic.......
Second, if it is that far out of wack now, you might be needing to
find someone with a freq counter and a freq generator, and scope
maybe.....
I have all of those things, and I dont even want to think about
getting into my TS820S without having someone like Bill around
watching me do it the first time, or at the least have him on a
speaker phone walking me through it.... Way to many transformers in
there for me.... Had a tough enough time with a 430S I had be working
on....
Before you buy more tubes, make sure the first ones werent bad by
getting someone to test them for you..

---> My reply to what Jim Volstad wrote 10/6/2003 11:30:13 PM

According to the manual, for SSTV it says: When transmitting, adjust camera output so that the final input power is less than 100W (less than 125 mA Ip)

That sounds high to me, but I have been dropping to about 45-50 watts on digital modes and have not had any problems (Yet)

Mike

811. Re: Rig to Soundcard Interface? (TS-520)

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-10-07 12:04:41 UTC
From: Jim
Topic: 806 Message: 811

Pete,

Before you spend a lot of money on a rig interface, make sure you need one! I don't know about the 520s, but my 820s has two RCA phono jacks for "Phone In and Phone Out", presumably to use with a telephone patch device. I figured it was worth a try, so I bought a couple of RCA to 3mm mini jack adapters at Radio Shack, along with some 3mm patch cords. I plugged my sound card directly into the rig and spent just a few minutes adjusting the VOX and sound level output so that it would key the Tx and so that I would not overdrive the receive side of the application (HamScope, WinWarbler, etc.). I was doing PSK and SSTV five minutes after I started.

Topic: 808 Message: 812

You want to hold your plate dissipation to 25 watts per tube for 6146A or W and 35 watts per tube for 6146B

If you are running 800 volts on the plates, multiply your plate current times your plate voltage, then subtract your OUTPUT power, then divide by two. That is your plate dissipation per tube.

If you are running 200mA at 800 volts, 0.2*800 is 160 watts, minus output power of 50 watts, leaving 110 watts or 55 watts per tube. Clearly, this won't work for long.

If you are running 160mA at 800 volts, this is 128 watts, less 50, leaves 78 watts, divide by two, still too high.

If you are running 60 watts out, at 145 mA, that's 28 watts left per tube. OK for 6146B.

So it all depends on your neutralization being right on (so your plate dip coincides with your max power output), and your driver being up to snuff and your tubes not being too tired.

If your plate voltage is higher, it may or may not cause your tube plate dissipation to be over ratings... you have to run the math for several different settings to see what works best.

50watts may NOT be the best setting for you, it may want to run 60 or 65 for best efficiency.

Also, keep your idle current down around 35mA, instead of 50mA. I have found the 6146 rigs run just fine there with no splatter complaints, and it gives you another 12 watts of plate dissipation "headroom".

Please do this: Once you get set up and decide what settings seem best, get someone with a good rig with good filters, that is receiving you around s9, to check adjacent channels for splatter and whatnot from your station while you call CQ or have qso with third party. Once you have determined that you are "clean" you can operate with confidence and more enjoyment.

PS, most PSK guys are using 10-25 watts, perhaps less, or so I hear...??

73,

Bill

Jim:

Thank's for the info. My 520S DOES have the phone patch (in) and
(out) RCA jacks. I'll give this a try and pick up some patch cables.

Just a couple of questions about this though;

What should my power output be set to, on say...20m?
Will this work for CW and/or Voice Keying too?
Anything else I should be aware of as not to blow up my rig?

Again, I appreciate the tips Jim,

Pete

From: G Bay
Topic: 808 Message: 816

I run a 530s (6146,s) on psk31 and feld hell, have worked all over the world
on psk at 10 to 25w and feld hell at abt 50w (cw type duty cycle) you can overdrive
very easily at power levels higher that and it adds nothing at the rec. end (program does
all the work)
That's with a dipole ant. by the way. Both great modes just let the rig warm up
for abt 15 min. and enjoy.
Gary WB3DSJ

radionut <radionutmike@...> wrote:
---> My reply to what Jim Volstad wrote 10/6/2003 11:30:13 PM

by the way, love PSK, been running some on HF as well as on 6 and 2 meters,
great mode!

By the way, just took a look at the Rascal docs and it says:

under no circumstances should the power output of your transceiver exceed
one-half the transceiver's maximum rated output.

Mike

---------- Original Message -----------

Just wondering what would be a safe output? If I drop the power out
to 50 watts, will it take PSK without over heating?

Hi,

I built the Rascal interface http://www.packetradio.com and it works great.

If you want to run less power, you can build the qrp circuit shown here
http://mods.dk in kenwood section. Just a 9v battery and pot that hooks to
the alc circuit via the 8 pin octal connector on back of the radio.

All this talk about digital modes and running at lower power etc... has brought up another question here. Having only used my rig (TS-520S) for phone and CW up until now, I have never tuned the radio for anything other than "MAX SMOKE" which for me is around 100w on 15m, 20m and 40m. How do I tune for less than max power? Do I cut back on CARRIER, LOAD, or DRIVE or a combo of all three? If someone has a step by step of how to best tune the rig for low power (NOT QRP), it would be very helpful.

Thank's
Pete

Fake it with 9v batt thru pot conn to alc input on the rig (the more negative to ground, the less drive you get).

Bill,
Whats the advantage over just cutting back on the drive?
Is it more efficient or what? Guess I don't understand how alc works.
thanks for all the great info

On CW no problem, just cut the carrier. On PSK and other digital modes, just reduce the mic gain to reduce power. On SSB, you will need to watch your output if reducing mic gain below point of ALC, because there will be no more "leveling" and the other party will complain that you are QSB when maybe it's not the band!

new rigs allow you to set the ALC point lower for less power and governed output. The tube rigs however rely on grid current to flow, which only happens at MAX SMOKE.

I have worked Venezuela (from Chicago) on less than 35 watts and a lousy 40 meter dipole up a whopping 20 feet. I bet I could have done it with even less. Just give it a try, if they don't answer the old CQ, crank it up another 5 or so.

Will it work for every mode? I don't know because I haven't tried it with every mode, but I can't see a reason why not. Just make sure the VOX delay is turned down so that you don't loose the first bit.

As for tips on not blowing up your rig, I just do whatever Bill tells me to do. So far, so good. Just make sure you get the right combination of RCA plugs and cables. The cables are almost always stereo (mine are) but I can't remember if the RCA adapters are also mono-stereo converters. I think so, but you might want to check.

Only tricky bit about any of this is getting your levels correct. I use the funny little icon on the task bar to turn the volume sliders ALL THE WAY UP, and then use the thumbwheel on my computer to control the input to the rig. Make it just high enough to trip the VOX relay reliably and you will be fine.

If you want to sked to test it out, let me know.

73,
Jim

Hi All,
i have been using my TS530S to do psk31,rtty and sstv using a
fairly simple interface i made. I don't use vox but use a simple one
transistor switch to do the tx/rx switching. feed the audio from the
soundcard into the mic socket on the rig and the ptt from the seriel port.
the line into the soundcard just goes from the phones skt on the front of
the rig. power controlled by the mic gain.
have used 50 watts on rtty and around 30 watts on psk31,about 50watts or
less on sstv.

The phone patch input may go through the mic gain pot... if not, you will need to either reduce the audio drive to the rig or "fake" the ALC into thinking an external amp is being over driven, by injecting a small negative voltage on the ALC input to the radio. Most guys use a 9v battery through a pot.

I have been using the Phone patch inputs on my TS-820S with a homemade rig to soundcard interface(Just 1 to 1 isolation for audio and opto-coupler for PTT) for all digital modes including SSTV(Using MMSSTV). All I do is set the soundcard audio so it is barely noticable with a headset and then adjust the mic gain for power. As long as I have no indicated ALC I can crank out anywhere from 1 watt up to about 60 watts just using the mic gain! I have worked SSTV as low as 5 watts with this method and as much as 30-40 watts on the high end with no reports of splatter and no rig problems. I use the same method for PSK, RTTY or any of the modes workable with software and a soundcard. Hope this helps Pete.

828. Digi-Modes SUCCESS!!

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-10-11 04:06:15 UTC
From: kmbadlose
Topic: 828 Message: 828

Hi All:

Just thought I'd update the group and thank you all for the help in getting some digital modes to work on my TS-520. So, I've connected my soundcard out to the PHONE PATCH in on the back of the rig and connected the soundcard in to the PHONE PATCH out. I have tuned up the rig for max smoke and then "tuned" again from the soundcard using MMSTV (SSTV) and WINWARBLER (PSK1) software by varying the output level of the soundcard to where I was peaking at only around 10-20 watts on my SWR/WATT meter. Also, set the VOX up so that TXing would trip the VOX when I wanted to send. MMSTV started rendering pictures right away, and I answered a couple of CQ's and got "closed circuit" RST's, so I figured it must be working OK. Then it was off to load up
WINWARBLER. I found the PSK frq on 20m and started listening. Took a
couple of minutes to figure out the software (should have RTFM) but soon was having a QSO with Texas and then CUBA. WOW THIS IS SOOOOOO MUCH FUN!!!!

Question is; I am just using simple mono audio cables with no in-line resistor pads or anything as JIM originally suggested. Do I NEED to add this (resistors), and if so what is the proceedure for constructing such a cable myself? Please keep in mind, I am severely "Electronically-challenged", so as detailed a description as possible always helps.

Thank's again to all for the help and suggestions for getting all this
up and running.

Topic: 830 Message: 831

Hi all,

I am now very pleased to have a complete line up of the kenwood TS-530S and TS-830S range of equipment (well OK, I havent got the TL-922 linear yet !).

I am currently marking up the equipment for insurance purposes and although some of the equipment that I purchased came with the original manuals (with the date of sale) I am curious which bit of kit is the oldest.

Does any one have a list of serial numbers that relates to the year of manufactuer?

Pete,

I would agree with Bill, if it ain't broken don't fix it!!! Now, if you feel the need to torture yourself there is a project listed on the ARRL website to build an interface to the TS-820S (I figure the 520S is pretty similar). The link is:

http://www.arrl.org/news/features/1999/0701/2/?nc=1

I went to Radio Shack, bought all the parts, sweated over a hot soldering iron with the usual amount of invective and grunting noises (like when I noticed that the audio transformer is backwards in the schematic, but only after soldering it in place and clipping the wires!!!). My final result was that I found it works better WITHOUT the homebrew interface; your results may differ.

73,
Jim

Right on, Jim!

hey I never said "if it ain't broke"... I am "mr. mod"
you know! But in digital radio, it's different! You
gotta know when to stop messing with stuff, and it's
just after you get the last bit of RFI tamed and start
getting 100 percent on your QSOs, hi.

PS in HF digital, ground aint' necessarily ground, and
more ain't necessarily better. Or maybe it is. and
FERRITE IS YOUR FRIEND.

834. Tuning up

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-10-12 22:31:16 UTC
From: Grant McDuling
Topic: 834 Message: 834

G'day guys,

I run a 520SE and am just getting the hang of things.
By the way, I found the guide on tuning that is on the
files section of the web site invaluable. But I do
have one (probably stupid) question: If I am only
working the 20m band and using a 20m dipole, do I need
to retune the rig every time I fire it up?

G'day mate,

Well, if there are no little fingers to turn the knobs when you are not around, and if you don't stray far from the last frequency you used, then it is probably not ABSOLUTELY necessary... But, just speaking for me, I always give the tune and plate knobs a little twiddle just be 100% sure that things are right on...and check to see that the plate current is about where it should be... Also, there is the possibility that the antenna characteristics might change somewhat... rain, ice, snow, dust, etc. makes a difference, or a broken wire, or even wire stretching over time...or after a big wind. So, the 5 seconds it takes to check and have peace of mind are a small amount of time just to be sure...

Just MHO,

73/DX

No sir.

Only if the cat is in the shack (cats de-tune rigs).

Just kidding!

Busy at the new job and running the farm... not been on much... seem to have some problem related to the VOX circuit... involuntary keying, and RX frequency shift... warbly... guess one of the boards is loose, or has dirty contacts... but no time to look inside...

You guys doing OK?

Can someone tell me the best way, if there is one, to solder nichrome wire? I was going to try to make new parasitic supressors for in a RF amp instead of copper wire, since I have been told that it lowers the Q of them, but I cant seem to get anything to "stick" to the nichrome, I tried regular, and silver solder..... Any suggestions?

Thanks
Rob

I'm not a metallurgist, but it seems to me, due to the wire being nickle plated, you'll have to remove the plating, leaving the bare wire to solder.

Dear Rob,

You will need a torch that generates about 1200 deg. The common campers butane torches readily available at cigar shops will do the job for a small application..(they claim up to 3000 deg.) Here is a link to follow to get the proper stuff to do the job...
http://www.fredparrcycledesign.com/brazingandsilver3.htm#Handy%20Easy%20Flow%2045

Good luck

Takes a special flux, low heat, and silver solder.

Do google search on "low q vhf parasitic suppressors"
and it will lead to the info

I will help you more, later... busy right now.

Thanks everyone for your input!!!
But I think Bill is right.....
I tried the torch after I tried the 15 watt iron, then
the 140 watt gun..... burnt a resistor pretty good doing that, either
way I tried I couldnt get the solder, either silver or regular to
stick....
I just need to find the RIGHT flux!
Ill try searching some stores tomorrow.....

R. L. Measures, 805-386-3734, AG6K

here is his website
http://www.somis.org/

Rich sells kits for making these low-Q vhf parasitic
suppressors... order a kit and you will have enough
stuff to make several pair, some for friends.

You need to solder these over newspaper, and the fumes
from the flux are not to be breathed.

Raleigh:

That sounds like the TS820S problem I mentioned to the list a week or two ago. I hear what sounds like the cycling of a relay deep in the case, there is a bit of a hum, and the RX frequency might or might not jump up 2.7 kHz.

If you figure out what's causing it be sure to clue the rest of us in, not that I'd actually be able to fix it... I'm no electronics man; my expertise was exhausted when I vacuumed the cat hair out of the enclosure. (There are still a few behind the glass of the meter.)

Ken

Busy at the new job and running the farm... not been on much... seem to have some problem related to the VOX circuit... involuntary keying, and RX frequency shift... warbly... guess one of the boards is loose, or has dirty contacts... but no time to look inside...

You guys doing OK?

Hi Ken,

My reply to the cat thing actually happened about three months ago... I usually leave the rig in CW where I work most often... The cat jumped up on the table and lay down next to me while I was working on the computer... unbeknownst to me, he was laying against the bug, and the rig was KEY DOWN... and stayed that way until it went SPUUUNNNGGGG and all the lights went out... sent it to Bill... Blew the finals and driver, but no other damage... darn rugged power supply... I now make it a point to keep the rig in SSB when I am not actually operating...

Bill,
Yes that is where I got the idea in the first place to change out the ones in the amp that I am rebuilding. He didnt have the amp I have listed, and I did email him to get a quote for my amp, but never got a response. So I just figured out the resistors I needed, and got myself a nice piece of 18awg nichrome 60 wire. I have them all built, now I just need to find the right flux so I can solder them together.....

Thanks!
Rob

Well from what I gather bill, it is Zinc Chloride. But after all my searching out, I found that RatShack has something called solder weld and it has silver solder in it, and also contains Zinc Ammonia Chloride as the flux, and it is supposed to be able to solder to nickel, stainless, chrome, ect.... So I think Ill give that a go around... Just think all this just for 4 new parasitics...This was a good exersize in case I would ever need to do this in my 820S! HI HI

857. Nichrome Wire Flux

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-10-16 16:25:19 UTC
From: rsakabu
Topic: 857 Message: 857

Sorry Group,
I hit the CR button and it sent the last message before I got to post anything.

I used nickel plated high tensile strength copper alloy wire once and ran into the same problem. The solder simply won't stick to the plating. So I found out that "RMA" flux allows the solder to stick much better. RMA stands for Rosin based Mildly Active flux. I believe it is ZnCl based like the stuff you have been discussing. It is sold in most decent electronics stores for about $10 for an ounce or two.
Be sure to use it sparingly and clean off all the flux after soldering. Otherwise you may turn your wire into a green powder after a few months (probably copper chloride). It is not a good idea to use it on stranded insulated wire because the strands will wick the flux or flux/cleaner back into the insulation. Bare single stranded wire is OK because you can clean the flux off pretty good.

Rosin based solder flux is usually rated: R, RMA, and RA
R - least aggressive and not corrosive
RMA - more aggressive and some manufacturers say it does not need to be cleaned off. I would be safe and clean if off.
RA - very aggressive and must be cleaned off immediately. Usually not recommended.

858. Voltage drop on transmit

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-10-18 19:50:54 UTC
From: Jim Volstad
Topic: 858 Message: 858

When I manually key the rig, it shows 900 volts. When it transmits however, it drops down to 800 volts. Is this a normal high voltage drop or is it something to be concerned with?

859. Re: [TS-520_820_530_830] Voltage drop on transmit

Yahoo group: TS-520_820_530_830 (2001 — 2004)

Topic: 858 Message: 859

Not to worry.

The 520 et al uses a voltage divider, so the least
little bit of load will drop it somewatt (sorry). The
first 50mA of bias will actually drop the voltage
about as much as the next 250mA of output will... so
it's a diminishing effect as you increase the load.

Thanks Roy,
I found a flux called "Ruby", it is a liquid flux from
a local harware store. And that did the trick. Took a bit of time,
but worked great! Nasty stuff that flux is.....
Thanks for everyones help!

861. PTT from Serial Cable?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-10-20 17:49:04 UTC
From: kmbadlose
Topic: 861 Message: 861

OK, my 520 is "psk"ing along quite niceley and i've been trying to figure out how to get the rig to switch to and from transmit via the MixW software that I've been trying out. It seems pretty simple since
you just have to complete a circuit between pins 3 and 2 on the mic jack, but I can't figure out how to do this via the serial jack on the
computer. MixW gives an example "simple circuit" for Serial but I can't figure out which pins from the serial cable go to which pins on the mic jack. If anyone who has experience with this could "walk me through" putting one of these cables together, it'd be greatly appreciated.

I am not sure if you have a DB9 or DB25 type serial port but with either you need to isolate the serial port from your PTT You can do that with a simple circuit a Optocoupler like a 4N33 or 4N37 will work fine.

You can use the RTS or DTR lines from your serial port. Some use the RTS for PTT and the DTR for CW keying.

On a DB9 the RTS is pin 7 and the DTR is pin 4, the Ground is pin 5. On the DB25 the RTS is pin 4, the DTR is pin 20 and Ground is pin 7 (in both cases when I refer to Ground I am referring to Signal Ground.

Mike & The Group:

Thank you so much for the very quick response. So, in the case of the DB-9 which is what I plan on using, would pin 7 from the serial port lead to pin 2 on the mic jack and pin 5 from the serial port lead to pin 3 (all through the Optocoupler curcuit of course)? Or am I still way off here? It's the "ground" that's got me confused.

You may feel free to slap me upside the head if I'm way off on this (hihi) :)

No, you would pick one of the two lines to use, I would suggest the RTS (pin 7 on DB9). In the software, it should let you select what you want to use and set that to RTS. In this case you would not use the DTR line at all.

Your connections from the DB9 serial port will be pin 7 and pin 5 (Ground). You will use these two lines to 'key' or turn on and off your Optocoupler circuit (or transistor switch circuit). Then from the output of that you can switch your rig. The output (switched side) of your circuit would go to the mic jack on your rig. No direct connection between the serial port and mic jack will exist.

Basically your serial port (lines 7 and 5) will connect to your switch circuit and turn it on and off (think of it as a relay) and then your mic jack will connect to the isolated output.

By the way, if you are not using isolation on your two audio lines you should consider it as well. You could set up a ground loop and/or introduce noise without isolating not to mention the REAL possibility of damage to your computer and/or rig if anything goes wrong. Isolation is important on all lines that interface the rig to your computer. It doesn't take much to cause damage.

<Stepping off soap box>

One idea you may want to try is to use to use your vox on your 520 to key the rig when you send audio from the computer. I have not tried it, so I don't know if the vox would be fast enough to switch into transmit and not loose any of the digital tones you are sending from the computer but it might be worth a try. Guessing you would have to set your VOX level to the audio input levels, shut off or reduce the anti vox and set your delay very short. Might just be worth playing with.

You will have the two pins from the mic jack connect to the output (switched side) of the circuit. When the input to the circuit is activated, it will complete the connections between the two connections on the output. It would be like shorting the two pins on the mic jack. When the input to the circuit is deactivated the path between the two output connected wires will be broken and like removing a short between the two pins on the mic jack.

869. Mic pinout on the 520-S

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-10-20 20:34:16 UTC
From: radionut
Topic: 808 Message: 869

According to my service manual, on the 520-S pins 2 and 3 are the PTT pins. Pin 3 is ground.

In the case we have been talking about you would short pin 2 to 3 to PTT

Mike

I'm about to do the qrp mod as described by Bill and on the mods.dk site and just had a few of questions about it:

1) Do you need a special plug, or can you just stick the end leads in the appropriate holes?

2) Is there a special kind of 220K pot required, or will any kind work?

3)Do I tune up the rig as per normal, or is there any other steps I must take once the mod is in place.

Best to use a connector, more reliable.

Linear pot is best, if you have one.

Yep, tune up as per normal, then crank 'er down. Get
a splatter report or two.

873. TS-700 and 820S erratic internal VFO

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-10-26 13:10:42 UTC
From: falcon2448
Topic: 873 Message: 873

Good afternoon everyone,

Names' Michael and I have 2 Kenwood rigs that exhibiting
the exact same problem.

First, TS-820S which has an external VFO (VFO-820) and it
works great, no problems. The internal VFO on the 820S
however, does not. Starting around 14.200, same on all bands,
the VFO and digital display go nuts, becomes instable. I have
removed the internal VFO, cleaned the rear bearing with contact
cleaner but it still exhibits the same problem.

Second, TS-700SP, same problem except no external VFO. On any
band setting, 144, 145, 146 or 147, at the same dial setting
the VFO and digital display do the same thing as the 820S does,
is unstable and erratic. I have not removed the VFO in the 700SP
because I assumed doing the samething I did with the 820S will
produce the same results.

Any ideas on what the problem could be? I've read various
inputs about the rear bearing and tension spring being the
cultprit. That's what caused me to clean the rear bearing
with contact cleaner. I didn't use a very thin file to clean
the surface because I don't have one that small.

When the VFO can, in the 820S, was removed, the inside of the
VFO was very clean and didn't show any signs of dirty. So,
I'm wondering if anyone has had the same problem and if so
what the cure was?

73's,

Michael

While it was apart did you rebend the tension spring? Based on your description of what you did it would seem you did not. Re-bend the contact tension spring to put additional force into the contact, you will need to remove the VFO cover to do this. Cleaning the bearing with contact cleaner (or any other cleaner) won't do a thing to help any electrical contact problems.

An easy way to confirm a poor electrical contact is to tap the VFO housing. If the frequency changes or goes out you have determined that the contact spring isn't under enough tension.

The same goes for the TS-700 VFO, check and repair it in the same way.

875. Re: [TS-520_820_530_830] TS-700 and 820S erratic internal VFO

They have the same exact fix: remove the VFO, remove
the cover, clean the compression fitting at the back
of the variable capacitor. It is a grounding wiper to
the rotor and is dirty.

Use Cailube MCL, apply one drop only to the fitting,
do not spray the capacitor.

I am a new member and want to thank everyone for all the useful information I have found here.

Now a question, is it possible to add a heater switch to the 520se? And is it worth doing if it can be done?

73 tom ka9vaa

I would not do it, doesn't really get you anything and
unless done right, will devalue the rig.

Hi this is probably a stupid question but i will ask it. i have a ts 503sp and want to run it at 5watts on cw. i know that turning the drive down will reduce the power. My real question is will it damaged the rig running at this power level. i am concerned that i might damage the valves. I did say it was a stupid question just want to put my mind at rest before i try it. all the best nigel m0dbo

No problem. If you want, you can re-dip the finals
after you turn it down, but in any case you will not
be exceeding the tube dissipation levels even if not
perfectly dipped on the plate current.

Hope to see you on QRP! Look for me on the low end of
ten meters, 28.020 to about 28.050; I try to get on
when I can.

73,

882. Keyer glitsch with TS820S

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-10-28 22:43:43 UTC
From: Ken Nellis
Topic: 882 Message: 882

Hello!

I have noticed that my keyer works fine with my TS820S on 80, 40 & 20 meters, but not on 15 or 10.

What happens is that when I flip the send/receive switch to send and key eeither a dot or a dash the keyer "sticks" and the tone sustains until I switch the keyer off or flip the send/receive switch back down to receive.

Does this sound like a keyer or a transceiver problem? I'm guessing keyer, but don't see why the same problem is not observed on the other bands...

Wish I knew how to remedy it. Inside the keyer there are 4or 5 mini potentiometers; maybe one of them needs adjustment.

Thanks for all your help in the past. This is a great list!

Ken

From: Mike
Topic: 882 Message: 883

It sounds like it could be RF getting into the keyer. When you key up on 15 and 10 do the panel lights on the radio get brighter? If the key cable to the keyer isn't shielded try switching to something that is, RG-174 works nicely. Also try winding the cable and any power cables (if the keyer needs it) into a choke near the keyer.

Ken, it's just RFI to the keyer.. Radio Frequency
Interference!

Ferrite is your friend... Ferrite is your friend...
repeat after me.. Ferrite... mmmm Ferrite... mmmmmm

Get some of those clamp on ferrite thingies and start
putting them on cords and stuff until the garbage
stops.

887. Tune up question

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-10-29 22:56:46 UTC
From: Grant McDuling
Topic: 887 Message: 887

G'day Guys,

Whe tuning up my 520SE (I have a 20m dipole) according to the manual, this is where my dials end up:

Carrier 1.5
Drive 11 o'clock
Plate on the extreme edge of 14
load 11 0'clock

Trouble is, the needle then reads max on the ALC scale (ie right over way out of the ALC box) on TX. I believe I should readjust the Carrier down to just inside the ALC box on TX. Is that right? Or shopuld I let it go all the way over, as tuning by the manual would suggest?

After using a 520 se for 25 years without any problem at all, I bid on a Working ts 820, Well I won or lost I guess. The vfo plug was missing, no problem, I had one, went to load up, turned it on and the meter went as far right as possible. Tried turning on in usb, lsb, cw and tune, same results, with the heater switch on or off it is the same. By flipping the send ☐ rec up and down the meter returns to zero. Ok, settings, meter rf- tune ☐send = zero on meter, alc ☐tune send=zero on meter. Oh, the ip reading is 60 mA. The car, drive, plate and load do not change anything.I tried all bands with the same results. Everything done with a 50-ohm dummy load. Has anyone any suggestions as to where to begin? I put in a new set of finales but no driver. I was assured it was a working rig.

Thank you for any ideas.

May just be a dirty relay... that is what switches the
meter around in receive and transmit.

I also have used TS-520xx rigs for years. When trouble occurs I always start with the power supply. There are several voltages, some very high (plate) and some low, 10-12 volts for control. With the HV switch in the off position check to see what voltages are present. If they are right you may have a bad T/R relay. The VOX board feeds the relay voltage and it's on top of the rig on the left side. Be sure that the fuse in the holder on the rear is the right size as the schematic calls out. If the fuse holds it's probably an open circuit. If the fuse blows then you have a short. I'd also recommend that you take the schematic to a copy store and have it enlarged several magnitude. It will make the work a lot easier! Then you can trace the power circuits with different color highlighters. If the trouble is in the HV line the electrolytic caps are probably leaking. Burgardt (sp)Electronics (ads in the QST) have HV caps. The ones I got were physically smaller but worked just fine. Hope this helps.

The ALC scale is handy for tuning your driver stage;
it shows you the drive that you are applying to the
grids of the finals. All you want to do is peak it;
you don't care where the meter is, as long as the CAR
control keeps it on-scale. If your rig is in TUNE
mode, you won't hurt the finals even if they aren't
resonated yet.

Then switch to Ic or plate current, and dip your PLATE
control. this will resonate your final PA plate
circuit

Then switch to RF out on your meter, go to CW mode and
go for max output on PLATE and LOAD.

That's it!

Can anyone tell me how much meter movement is NORMAL when in the TUNE switched mode? I realize it runs the rig in very low power, but my meter just hardly moves...maybe goes to about the 1 S unit level at the highest setting, but no more. And it only moves this musch when Meter switch is in the RF mode and tuned for maximum power...its even less movement, maybe 1/2 an S unit,when trying to dip it with switch in IP position. I thought this was too little meter movement,and this group told me to check for burnt reistor in the tune circuit, but another operator says that this is normal...is he correct, or should I be getting a lot more needle movement while in TUNE mode?
tnx!

TUNE mode should give you about 50 watts out, maybe as
low as 35. What is the ALC meter doing?

I get the same thing with mine but found that by using the ALC setting in TUNE mode that I can effectively "dip" the plate by adjusting drive for max meter swing and both plate and load for lowest meter swing and everything seems to run fine (I check the settings using an SWR meter and everything looks ok - might can tweak a few more watts out using the SWR meter).

...and what's the problem with just watching the forward power on your watt meter and tuning up for maximum "smoke" (forward power)? That's the way I tune, then go back and check the ALC and turn down the drive until the ALC is at the bottom of the scale. If using sideband (either one), i then turn the drive down to minimum, and adjust the mic gain until the ALC just comes up a bit less that halfway up the scale on voice peaks. Have been given exceptional audio reports...and if I switch to CW, just bring up the drive again until it just bottoms out at the bottom of the ALC scale. Never a problem...and have the tubes forever...(20 years).

897. TS-830S Sidetone Osc Problem

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-11-02 15:28:36 UTC
From: w2aew
Topic: 897 Message: 897

I finally got around to working on my sidetone oscillator problem on the TS-830S. Originally, it didn't work at all. Now its working, but I have a NEW problem with it.

The fix: I checked the usual semiconductors (AF board, Q1, D1, etc.), and they were OK. The problem was traced to the STE signal (connector 2, pin 5). This line is grounded via the mode switch when in the CW.W and CW.N position. When grounded, it enables the bias on the oscillator transistor Q1. The problem was that this line was broken off at the mode switch. Ah-ha, I fixed it - or so I thought.

The NEW problem: With the STE line re-connected to the mode switch, the sidetone oscillator now works! But, there's a new, weird problem. Now, whenever I insert the 1/4" plug into the KEY jack, the sidetone oscillator comes on (in CW mode). This happens even if an "empty" 1/4" plug is inserted. NOW, here's the WEIRD part. The open-circuit voltage on the key is about -60V (as usual). If I "short" the key contacts with my sweaty fingers and drop the voltage to about -35V or so, then the oscillator turns off, and operates NORMALLY with the key.

Any ideas from anyone?

Thanks in advance,
Alan W2AEW

This info is based on my TS-830, but the other models are similar. Assuming that you have the PLATE knob in the right position for the band...

On TUNE, my TS-830 shows 15 to 20 watts out when I peak the DRIVE knob. With the meter switch set to IP, the needle is at the 90 mA position (which is about the S3 to S4 position).

If you don't get much reaction from your DRIVE knob, switch the meter to ALC, and make sure that on TUNE the needle goes somewhere in the marked ALC range (mid or lower half of the range is fine). If not, increase the CAR knob until it does. The CAR setting may change from band to band.

See if the IP meter is now giving you a better peak when you adjust the DRIVE.

To all who replied to my follow up question abt the TUNE MODE problem I am having, TNX!! I ment to tell you all that Turning UP the CAR Does NOT make any diffence in the low TUNE needle movement I am getting.. but ALC readings are OK.

So,now to Answer All UR Questions:

TO Bill, K0ZL: In the TUNE mode, I am getting only 1/4 watt output on an outboard Power meter, when the rig has been properly tuned using my usual method of tuning for max somke. Also note that, the ALC DOES work in the TUNE mode and I get full meter swing as I adjust the DRIVE Control.

TO Daveview1975: KF4CQS, Ur method of disregarding the low TUNE reading and using the ALC readings only in TUNE Mode, does not not seem to work well for me as there is far too much "play " in the knob settings to corresponde to a good tune up, when compared with a tune up for max. smoke and matching low Ip dip reading.

TO Greenmoldy: Nothing is wrong with ur idea of using a power meter and tuning for max smoke, and this is how I have been tuning..however I start in CW Mode, with the CAR set low, for abt 5 watts out in order to reduce QRM , and peek power out. Then I touch it up with CAR set higher to get abt 100-105 Watts out.

It would be nice, however, to use the TUNE mode, as intended by Kenwood and would like to make sure the TS820S is working correctly in the TUNE mode. Obviously, because in TUNE mode, I only get 1/4 watts out, there is something wronge with the circuit. (even with CAR turned up)

TO NJ1F: I have never heard of ur method of turning down the DRIVE to get the ALC reading to the bottom of the scale, after peaking it for tune up. I was always taught to adjust the DRIVE for a MAX meter reading and to leave it there. I then use only the MIC to adjust the ALC for just a moderate needle swing, and of corse never beyond the top of the ALC scale (when using SSB).
I am only getting 1/4 watt output in TUNE mode when I peak the DRIVE knob. Adjusting it will only reduce the meter reading from about 10mA (the maximum IP reading I get, while in TUNE MODE) to zero scale deflection.

This Small meter movement is just barly enough to do a tuneup in the TUNE mode, and I can do it, (i.e., it does correspond to a low IP dip and max RF out when comapred to a tuneup in CW mode) but it is not easy to do, especailly depending on the band, nor does it appear to be the way the factory designed or intended it to read/work.

Hope this covers everyones questions...sound like there is something wrong, by virtue of the fact that in TUNE mode, with CAR turned up, I am only getting 1/4 Watt out, were as abt 50 W is norm. And yet the ALC function of peeking the DRIVE setting works fine inthe TUNE mode....Please note that tuning up in the CW mode works fine and all controls and meter readings are as they should be.

Now it ur turn again!
tnx es 73
Greg

NJ1F...sri, I got my answer to you partly mixed up with my answer intended for "Greenmoldy". It was Greenmoldys recomondation that the Drive be turned down after peaking it for ALC......BTW, Greenmoldy', I also get excellent, unsolicited audio reports....that the TS820 is a nice sounding rig probably has something to do with it too! I will, however,look into ur recommondatin of tuning up the DRIVE your way (It is just very different from any method I have ever heard of, but think I understand what u are trying to accomplish, maybe Bill can comment under a NEW posting about your method)

To NJ1F, I hope I answered ur question ..my IP and power out in the TUNE mode is too low compared to ur readings. Using the DRIVE and CAR does affect the scale of the ALC reading in TUNE MODE, and I realize that the actual nominal ALC reading isnt important, as long as its peaked...tnx.

Watt (sorry) is your plate current in TUNE mode and
can you get a dip? How much of a dip?

I am thinkning your plate tank circuit switch and the
rest of the bandswitch are out of mechanical sync!!!

Don't laugh, had one like that here while back... used
the dip meter to find the right position for the
switch, was about 90 degrees off from rest of the
system. The coupling had slipped.

902. Quick Question

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-11-03 00:58:37 UTC
From: A. Nelson
Topic: 902 Message: 902

Hello all...A while back i purchased a used TS-520s and let me say i hope i have it forever. My question is this: when i got the radio home i noticed it had been modified for 11 meter operation by changing of the 3 10 meter crystals. I have since changed those back and the radio functions on 10 now, but the sensitivity appears low. Is there any other adjustment i should make to peak the receive a bit? Thanks for reading.

Art WB9HNJ

903. Re: Tune up question

Yahoo group: TS-520_820_530_830 (2001 — 2004)

From: Greg
Topic: 887 Message: 903

OK Bill, here's some more info for your brave soul....
(If I understand what u are saying, I dont think there is a PLATE alinment problem as the problem is the same regardless of where the PLATE knob is adjusted..a 360 degree spin, and still no movement on the IP meter position) but I sure am not a pro, so I'll leave it up to ur insight!

1. In the TUNE mode, when ALC is peaked and meter is in the ALC position, I then get a reading of 300mA after "dipping" the Plate knob......In the CW mode, the reading is at abt 160mA after dipping, and again, the plate knob is in the proper position indicating the band used (75 metres)....I realize the "number value" of these readings are not important, only their "magnatude" or relative values.

2. Here's the same info as above, but this time with meter switch in the IP position (not in ALC position): In the TUNE mode, I get NO, or miniscule meter movement as I turn the PLATE knob, at least in the 75M band...(I think I do get a LITTLE meter movement(moves from 0 up to 5 or 10mA) on higher bands though). The meter shows abt 10mA, regardless of the CAR setting on high, or the PLATE knob setting position. On some bands, it will "tune down" to 0 mA (down from abt 10 mA) and that amont of movment is all the dip I can get. (It cant go any lower than zero ,hi,hi)

In the CW mode, (rather than the TUNE mode), again with the meter in the IP position, I can dip down to 220Ma, and the meter seems to work fine. As I turn the PLATE knob, the meter, indicating IP, will go from a high reading of abt 320mA, down to 220mA and does so at the proper band position on the PLATE dial.

All the meter switches and band switchs seem to feel ok and dont rotate past the correct indication markings, so perhaps you mean that the waffers themselves may be out of alignment inside the rig?
You would think that if so, it would creat problems with the readings when I am in the CW mode or tuning up using the RF meter postion, but all seems ok, including by HV readings etc.

You once suggested a burnt out resistor in the TUNE curcuit, which is preventing the tune power from being higher...I was going to check this, until I was told by a very trust worthy TS-830 user that this "TUNE behaviour" is completely normal and that is how his rig acts as well...perhaps he misunderstood me.

I can use the meter in the ALC position, and dip it, (while in the TUNE mode), but it doesnt seem accurate enough and it still doesnt

address the low TUNE power output reading on my outboard power meter.

Does this info help and should I stick to your previous advice of
long ago, when u suggested checking for a bad resitors between the
TUNE switch and tube section?

Finally, with the meter in the RF postition, in TUNE, I get maybe a
little more meter movement than when in IP meter position. It shows
maybe from 0S units, up to the 1S unit postion at its most "maximum"
indication and this coresponds to max power output as I dip the plate
knob...so even thought the meter hardly moves, I can use this to get
me close...

In CW mode, RF meter position gives me a good full meter swing that,
as the PLATE knob is dipped to the correct band postion, correrponds
to an IP dip. (Rig seems to be neutralized ok)

Too much Information? Hope this clears up all the possible situations.

Hi Art.

On the RF unit there are several cans for ten meters that may need peaking.

Take off the top cover; find a good plastic tool that will fit the smaller cores in the small silver cans.

Find another plastic tool that will just fit the open coil cores at the back, near the PA cage. These are the driver plate coils.

Put it on ten, receive mode. Rig hooked to dummy load. Turn on the calibrator and find a sig at 28.400 mhz. Watch the s meter. Set the preselector control to about 12 o'clock.

Carefully tune the front and middle coils that are marked 10 on the PC board, under the bandswitch shaft. Bright light is a big help! You will be tuning for maximum audio, or max S meter reading on the CAL signal.

If that works (you should see s6 to s9+ on the calibrator), then go into TUNE mode with car control full CW (max). Switch to ALC on the meter; if you have a reading, go to step 2.

1. if no ALC reading, switch to PLATE. See that in TUNE mode, CAR full CW, in TX mode, plate comes off the left peg. Leaving the PRESELECT control where it was for RX, carefully tune the 10M coil near the back for max plate reading. At the point where plate current doesn't appear to increase any more (about 120-150 mills at resonance), switch to ALC. If you have ALC reading now, go to step 2.

2. Continue tuning that driver plate coil for max ALC reading.

All this should take less than ten seconds. YOu are in tune mode so no damage will occur to the tubes.

Switch to CW mode, TX, tune PLATE and LOAD controls for "max smoke" to the dummy load.

You should see at least 75 watts out on ten, hopefully more like 90-110. To check the receive, hooking up an

outside antenna should increase noise in the receiver
a bit. Local noise sources should be sufficient to
check the receiver, even if the band is not open.
Which, by the way, it is today.

73!

Bill

905. TS520 - Very Low or No Power on 10 ???

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-11-03 14:13:39 UTC
From: Werner, Klaus
Topic: 905 Message: 905

Hi,
During CQWW SSB I was hoping to work some stations on 10m, however found that tuning up was useless, i.e. on about 28.4 MHz on DRIVE/ALC got no needle movement, on PLATE/IP and PLATE/LOAD/RF very little needle movement. On setting USB/IP I got the recommended 60mA (also on all other bands). Also no mic gain indication.
However, being an optimist, I started calling anyway and managed to work a few stations - watching the external power meter it looked like about 5 to 10w, however, it was still hard work, perhaps the modulation wasn't that good - but couldn't get reports of course.
Haven't looked at 10 again since the contest weekend and write this from memory. Does this sound familiar to somebody? Where should I start checking - I have the service manual - but am not a techie ...
Thanks & 73

RF power is not making it to the antenna. All else is
OK. Look for a bad connection between the tank circuit
and the antenna t/r relay.

Good morning. The 10M issue has been a problem for years. I have two TS-520 rigs. I tried changing the driver tube and that improved the output some. I also cleaned the bandswitch with contact cleaner and that helped a lot. To start, try turning the bandswitch from one end to the other several times then settle on 10M. If you get no meter indication try tuning up on 15M. The settings are nearly the same as 10M. Finally, if nothing else, try tuning up using the external wattmeter. I get about 25 watts in tune position on 10M and about 55 watts CW. From what I hear that's about normal.

You should be seeing from 75 to 110 watts with good
tubes, CW mode, ten meters. If not, and you are
getting good alc action on voice peaks, I would check
the screen voltage to the finals... it may be a little
low.

TNX for ur help Bill...I will look at the schematic and rig...I guess the circuit for measuring the IP in TUNE mode, and displaying it on the rigs meter, is somewhere in or after the tank circuit to antenna t/r relay? (as well as displaying the relative RF on the rigs meter in TUNE mode)
Just to confirm; with the "correct" TUNE RF power (aprox 50 W at the rigs output) going from the tank to antenna relay (and on to the antenna output), I should be getting abt 40 - 60 mA when using the TUNE mode, not the 2-5mA ? (which is the most I can get)

SRI to beat this to death,I had a head injury a few years ago and sometimes miss the obvious or misunderstand the simpler things.

UR statement.."all else looks ok" just threw me off a little.

thanks for ur patience.

Ip is plate current. There is a cathode resistor in the tube cathode lines, leading to ground. As plate current increases, the voltage drop across the resistor(s) increase. This is what is sent to the meter as Ip.

Ip should "dip" as you tune the plate turning control through resonance. The amount of the dip depends on the setting of the "load" control.

The plate tuning and load controls are part of a "pi" matching network between the antenna and the tubes.

Tubes like a high impedance; antennas are low impedance; so you have to provide a transforming action of sorts to get any power transfer.

The "pi" network accomplishes this. As you tune the "TUNE" control and find the resonance, you are locating the point that the tubes "like" to operate into the pi network. As you rotate the LOAD control, you affect how the pi network "sees" the antenna.

At the point you achieve about a ten percent dip in plate current, your match to the antenna thru the LOAD control will be about right. The LOAD control controls how much "dip" you will get, when tuning into an antenna or dummy load.

Now... if you are seeing a good amount of plate current, and a good "dip", but no output or very little output, that tells me there is no good connection from the pi network to the antenna. We either have a burned or damaged component or a broken connection, or a bad relay, or something.

I assume the radio is receiving well, no?

TNX agn for ur excelent and detailed explaination of how the Ip info is sent to the meter etc...I have a pretty good handle on how the Pi network works etc, but what is throwing off my understanding is, where is the difference between how the system works when tuning up in the "CW MODE", and tuning up in the "TUNE MODE" (e.g. a simple resistor to run less current to the cathode?)....I do get good dip and lots of RF and everthing is fine in the CW MODE, but no dip or RF in the TUNE MODE.
The problem isnt when trying to dip using the PLATE Knob (or "Tune" as it is sometimes called), it is when I use the "TUNE" setting on the MODE switch I am not getting enough RF to generate a dip.

Your last paragraph asking abt good dip etc, is where the problem is...(but only when the MODE switch is in TUNE position)...when in "TUNE" MODE, I get no meter movement or RF out (or at least, very little..see my previous posts).BUT, I DO get good dip etc when tuning up with the MODE switch in CW, rather than TUNE. SO , I will look for something wrong from the TUNE switch and onward to the Cathode area and t/r switch etc as you suggest. I will at lest look for the obvious burt resistor, esp in the Cathode line and from the TUNE postion of the MODE switch onward.

And yes, the recv is working Great, regardless of whcich MODE I am in.(Including TUNE MODE)

Thanks for all ur help everyone, esp to BILL...I am glad to find out that there is a problem and the TUNE MODE is not, in fact working correctly, contrary to what I was told.

OK gotcha.

All TUNE mode does is drop the screen voltage on the finals from around 270 volts or so down to about 170 volts; this protects the plates from melting down if something goes wrong. I would look at the screen voltage and make sure the voltage divider on the RECT unit is OK.

Hi Folks,
turned the band switch a few times and now find I get reasonable
meter indication when tuning up. However, no ALC indication when
I key up the mic on SSB (I got a hand key somewhere as well ....).
The external meter tells me I am getting up to 100w on a medium
MIC/DX setting. Need to check out what the modulation sounds like.

By the way, did you know that the SG switch on the
back can be switched OFF to prevent transmission? I
call it the "grandkids" switch. Will save finals,
face, and power transformers if they are running
around unsupervised for some reason.

Klaus, ALC works off of grid overdrive, believe it or not (this is not a bad thing; when a tetrode or pentode starts to draw grid current, it's an indication that you are near the maximum rating of the tube in those conditions and it will soon flat-top on you; therefore, a small amount of grid current can be used to control the gain of previous stages, to reduce drive, until the overdrive condition disappears (as between syllables!).

If your driving stages have insufficient gain, you can still see 100w but no ALC voltage. This just indicates a need for alignment or a weak 12BY7.

918. Question RE; CW circuit/DB-9 serial

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-11-06 05:34:59 UTC
From: kmbadlose
Topic: 918 Message: 918

Me again;

The journey into building my first (useful) electronic circuit continues. I have built the interface from the following website...

http://www.mixw.net/hardcon.htm (the DB9 one near the top of the page)

to run digital modes on the TS-520. The PTT part of the circuit works perfectly but I can't seem to get the CW half to work. It is the identical circuit to the PTT one. At the end, I am going from the
collector of the transistor to the center wire of my CW cable and the ground (emitter end) is going to the other wire. When I attach (even just the center wire) to the circuit, I get a continuous tone on CW (that's with or without the DB9 even attached)

Does this CW circuit not work on the 520, or is there something I'm doing extremely wrong.

As usual, any thoughts or suggestions about this would be greatly appreciated.

Pete
VE3BHP

919. Re: [TS-520_820_530_830] Question RE; CW circuit/DB-9 serial

Yahoo group: TS-520_820_530_830 (2001 — 2004)

From: w2aew@arrl.net
Topic: 918 Message: 919

The CW portion doesn't work because the TS-520 uses grid-block keying for CW. This means that the open-circuit voltage present at the key is about -60V or so. The circuit shown in the schematic is designed for modern rigs which have a smaller, POSITIVE open circuit voltage at the key. When you connect the circuit as shown, you are saturating the 2N4401 by forward biasing the base-collector junction, which pulls the key line near ground, keying the rig regardless of the state of the DTR pin. Here's an idea (off the top of my head) that should work: 1. Remove the 2N4401 transistor 2. Install a PNP transistor, such as 2N6730 as follows: Base to Ground Emitter to junction of 2.2K, 10K, diode cathode Collector to CW KEY Note that the transistor used is not too critical, except - it must be PNP and it must have a Vceo rating that is greater than the open-circuit key voltage. So, measure your open circuit voltage (voltage across the key when not keyed down). Be careful, the voltage will be negative (i.e. connect the positive lead of your voltmeter to ground, and the negative to CW KEY). The transistor's Vceo spec should exceed this measured voltage by as much as possible. Quoting kmbadlose : > > > > > Me again;

Hi ALAN: Thank's alot for the quick response. I measured the open voltage at the key which is -62.0V. So, is there a specific PNP transistor I should get to replace the one in my circuit, or will any that is rated higher than the 62volts do? I really appreciate the help. Pete, As long as its Vceo is greater than 62V, you should be OK. The greater, the better, to give some margin against breakdown. The device I mentioned is one possibility, also NTE-383 would work, 2N5400, and many others. It all depends upon what you've got available to you locally. The NTE line is commonly carried at the electronics stores that typically serve the repair industry. I'm not sure what you've got locally that might carry what you need. Hey ALAN:

OK, picked up the NTE383 today and plugged it into the circuit as you described... and VIOLA!! PRESTO!!! Instant keyboard CW sending. I thank you VERY MUCH for the suggestion, and learned a little more about electronic circuits again to boot. Now I can add the interface to my collection of "dorkage" <- (nice word your xyl came up with... mine has been trying to find a good word for it for some time... and now she has one. Thank's)

This group rules!!!

Hello Pete,

Very cool! I'm glad that my simple suggestion worked. Not bad for an idea that just came off the top of my head, huh! You ought to send your results to the owner of the website that had the other circuit on it. That way, they can add it to their circuit collection for the older, negative keyed rigs.

Congrats on your dorkage addition!

924. How much does impedance matter?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-11-09 00:06:33 UTC
From: Jim
Topic: 924 Message: 924

I am about to do the factory described mod to my TS-820 so that it interconnects to the R-820 receiver. Apparently, when these rigs were new in the 1970's, the R-820 came with a transceive cable and an extra piece of thin coax to do the mod. So, I need two pieces of coax - one to go from the 9 pin VFO socket on the rig to the 16 pin Hirose connector on the receiver and another short piece that runs from PD Unit HET Output to the IF out.

Now, in the R-820 manual it says the supplied coax is 75 ohms (1.5C, 2V). Does it matter if I use 50 ohm? I know you are supposed to match impedances whenever possible, but . . . is there going to be that much loss in a few inches?

After searching the earth (literally) to find the extremely elusive Hirose connector, I don't want to screw this up!

73,
Jim

Jim,

The coax which connects your TV is RG-59 or most likely RG-6... that is all 75 ohm stuff. Problem is that usually it is tape and braid construction and very difficult to solder to the braid. The center will be copper plated steel wire.

926. TS-520S up for sale

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-11-09 17:05:29 UTC
From: k9zy
Topic: 804 Message: 926

Thanks for the good advice, below. I've learned a valuable lesson about doing things right the first time. I was intending on selling the 520S when I messed up the drive coil alignment in the first place. So... I'm now looking to sell this one to anyone who is interested in picking this one up who can fix it themselves.

I'm quite confident I did not mess up the VFO with my metal tool use... The bands dropped out one by one as I adjusted their coils, no one big failure. I've got too many house and antenna projects to get too and this 520 will sit for another year before I can get to it to try and tune it proprely, and it looks like I may not have the instruments I need to properly restore the alignments anyway.

If anyone is interested, please drop me an e-mail with an offer. K9ZY@.... I'm located 25 miles south of Sacramento, CA or could ship. I have an extra set of tubes (3 total) and a few pics if desired for you to view the unit. Cosmeticaly it has wear marks on top front edge, and a few on the controls, probably an 8 out of 10. I have the original manual, and an after market handheld Cobra mic. It has the SSB and CW filters. This unit is missing the side control cover.

Thanks,
Mark

Unless you physically shorted something out there is no permanent harm done. The reason for not using metallic tools is that they change inductance and capacitance values simply by being near the component you are adjusting. You can use metal tools for this but you need to pull the tool away to get the 'actual' value you have adjusted to. Plastic tools make adjustments a lot easier but metal tools aren't going to harm anything.

Yes, I am familiar with the TV stuff from trying to put connectors on - pretty nasty stuff. What I am wondering is what happens if I use the 50 ohm thin coax I bought at a recent hamfest for this purpose. Given the application, I wonder if coax was used simply to contain the signal inside the shield and the impedance is less important.

If you think I need to match the impedance, does anybody know of a source that can supply small quantities (6 feet or so) of the right stuff?

73,
Jim

Jim, I am guessing that the cable capacitance might be
a factor more than the impedance. I know that the
kind of LO connecting cables used in the Drake twins
is important... not so sure about the 820.. Heck use
the RG-174... there's probably a work around to the
different capacitance.

From: Greg
Topic: 930 Message: 931

Dave, I have the original ariticle and also a copy of it, (which I am sure I downloaded from somewhere on the internet...but I cant remember where!)...If no one else can tell you where to download it from off the net, let me know and I will scan it and email it to you. (I'll also post it to the groups FILES section at that time, if ok with the moderator.)

I have not done it myself, but it looks fairly easy, especially if you are intereted in adding only one of the bands, (esp. 17 metres.)

932. Getting more smoke

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-11-13 22:42:33 UTC
From: Grant McDuling
Topic: 932 Message: 932

G'day fellas,

I am baffled as to how I can get more smoke from my TS-520SE. This is the situation:

When I tune up the rig as per the instructions, all goes as expected. I then turn my attention to getting the SWR right. I do this by keying down and twiddling the knobs until the SWR gets as low as I can get it. I can achieve an SWR of 1.3:1 on my basic Power/SWR meter with power indicated at 80W. I then try to squeese some more smoke out by revisiting the basic tune up steps as previously done, but there isn't usually much to be had. So, I presume this is it. Is it not possible then to get 100W out?

The next thing I have noticed is that when I switch modes from CW to USB and tansmit, the SWR remains at 1.3:1 but the power needle fluctuates around the 20 or 30 mark. Is this to be expected? How can I get more smoke out on SSB? Or is that it?

I would suggest you get ARRL/QST permission to post an article up on the FILES section or anywhere else for that matter. They get very "squirrelly" when people post QST articles somewhere without their permission.

Are you tuning the RIG to affect the SWR, or an external tuner?

It's not good to use the rig as a tuner.. You could get a good "match" at the expense of not properly loading your finals...

I am baffled as to how I can get more smoke from my TS-520SE. This is the situation:

When I tune up the rig as per the instructions, all goes as expected. I then turn my attention to getting the SWR right. I do this by keying down and twiddling the knobs until the SWR gets as low as I can get it. I can achieve an SWR of 1.3:1 on my basic Power/SWR meter with power indicated at 80W. I then try to squeese some more smoke out by revisiting the basic tune up steps as previously done, but there isn't usually much to be had. So, I presume this is it. Is it not possible then to get 100W out?

The next thing I have noticed is that when I switch modes from CW to USB and tansmit, the SWR remains at 1.3:1 but the power needle fluctuates around the 20 or 30 mark. Is this to be expected? How can I get more smoke out on SSB? Or is that it?

Hi Gang..I do have the article scanned, but it is a large 35 meg zipped file. Unfortunatly, I have no way of converting it to a PDF or DJaVu file, which would make it much easier to loan-out.

It is too big, in its uncompressed format for the sites File section as there is a maximum upload size limit. Also, for posting there, perhaps Bill can ask ARRL or the author for permission first. Then I could send it to a group member who can convert it to PDF and then they can upload it to the FILES section.

I have 3 or 4 other small QST articles that apply to the TS820. If Bill does get ARRL's ok to post them, I can scan them for the group files section once we figure out who can convert them (They would take too long for members to download from this site otherwise)

Contact me directly to discuss a work around or for an attempt to have it e-mailed, but I wouldnt count on it working as I am on dial up. In the meantime, Ill see about purchasing a PDF convertion program.
Unfotunatly, I did once have a PDF file of it, but can no longer find it.

There were actually three articles on the 820 conversion:

Jan 1984 QST49More On The TS-820(S) WARC Conversion
(Technical Correspondence)
Keywords: MODIFICATION KENWOOD TS-820 WARCCheek, Robert, W3VT
Nov 1983 QST61WARC Bands for the TS-820(S)
(Feedback)
Keywords: MODIFICATION KENWOOD TS-820 WARC BAND

Feb 1983 QST36WARC Bands For The TS-820(S)
Keywords: MODIFICATION KENWOOD TS-820 WARC BANDCheek, Robert, W3VT

TNX to everyone for your offer to help. The Article has been converted to PDF to make a smaller file, tnx to Jamie, KC8KXI. Pls e-mail me directly for more info. (It is a 10 meg file and slow if e-mailed to you. It would have to be done in sections)

Bill if you feel its OK to Post in the FILE section, please e-mail me. It would probably be bests to get ARRL's ok. Perhaps you can also get the ok to post the other small articles as discribed below.

RE the other QST articles; I DONT have the Jan 84 Tech Correspondence so I cant comment on what it contains. I do have the Nov 83 Feed Back, which is a small 7 line correction to Feb 83 info (just typos).

There are 3 other articles with info on the TS820 that may be of interest to the Group: FEB 81- Full QSK for the 820, DEC 83- Using Schotky Diodes to Improve the 820, DEC 83-Keying cct Modification from -65v to +4.4v

Hope this is of interest

Hello All:
I am a new to this group. I have a Kenwood TS820 that has passed on. I had a tech check it out, he said everything was perfect except the Brain module is dead. Can this thing be repaired and is there anyone in California that can do it.. I'm willing to drive to get it repaired, But I hate to think what shipping on a TS820 "bag of cement" would cost. I don't know anything about this rig, so I can't talk techy. Is it worth trying to bring it back to life? thanks for any help.

It's not that much. My TS-830 cost about $35 to ship via UPS across
the country. Just pack it well, the extra cost of more foam and
bubble wrap is well worth it. Don't use crumpled newspaper, it's
compresses and is worthless when it comes to protecting something this
heavy.

942. Re: [TS-520_820_530_830] Should I dig a hole?

kg6fft63:

This is only a little help I suppose, but when I had my TS-820 shipped to me, double boxed, via UPS the charges were a little under $20. Not as bad as you may have been thinking.

Ken

Shipping not that bad--double layered boxes when I sold my 830 and vfo 230 from Mich to NY and only cost about 35.00. Beats price of a new rig, which you are going to pay shipping on anyway.

OK well you have a dead VCO section; also something else, as the VCO is used to track the VFO for the counter. You also get your band information for the other circuits from this. Did the tech take the VCO/PLLsection apart and clean the inter-board connections?

You have a great wife, like mine... she's always for a new rig, anytime. Tower too!

Did God bless us or what dude?

Congrats on the 847, can't go wrong with that one.

Absolutely

Also, I forgot about the acc plug in the back. I sure hope that little old black, 9 pin round plug is in the socket on the back of the rig, or it won't play. Thanks for reminding me about the VFO... duh... eeeeeyooooooorrrrre

Hi Guys, I would like to thank all of you for your help with this information. The response from this group and from Amateur repairs has been fantastic, i hope it has inspired a few other folks to have a go and keeps these rigs in circulation for even longer.
73s and thank you all
Dave

950. TS-830s info

951. Opinion wanted 530 vs 830

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-11-21 13:58:18 UTC
From: ka9vaa
Topic: 951 Message: 951

Ok, I know asking for opinions is asking for problems. I have been using a complete 520se station since 1981, I purchased new and have had zero problems in 22 years. Now I would like to buy another hf rig. My choice is a 530 or 830, the main reason being I want to try the warc bands and I like Kenwood radios.I will be using it for mainly ssb as my hearing is not so good in cw anymore. It seems these two are pretty much alike and I would like comments from anyone who has used both, I've looked on the web and most opinions I find say one or the other is best, not really a comparison of the pros and cons of both.We have club members here who have used one or the other and it does no good to talk with them. As theirs is the best. I know the modern radios have all the features but I like the radios I grew old with, I started with a Echophone in 1954. I hope this is not the wrong question for this forum.

Thank you for any comments

73 Tom

Since both are now just about the same price +/- depending on
where/when you find one, I would go for the 830.

The 830 has two IF slots for Filters, 8.83 MHz and 455 kHz, this
allows for more filter slots available, but more importantly, it
allows you to shift one IF relative to the other. This lets you
adjust the bandwidth from 2.4 kHz to 500 Hz in SSB and CW with just
the stock filters. Of course the 500 Hz setting will give you a shape
factor based on the 2.4 kHz filters and is not as good as a single 500
Hz crystal filter, but you may find that you don't need one if you are
a casual CW op. You certainly don't need a 1.8 kHz SSB filter for
crowded conditions. The 530 has only IF shift which is OK so long as
there isn't QRM/QRN on both sides.
I believe that the 530 also does not have an 8.83 MHz IF out
(someone correct me if I'm wrong). The 830 does have an IF out and if
you are lucky enough to find an SM-220/BS-8 you can use it to get a
spectrum display of signals near your tuned frequency (like a poor
man's 756/Pro/Pro2). Some say it's a gimick, but I find it very
useful to see band activity near me. It's great for finding and making

contacts.
There are a number of problems that can come with such an old
radio, but most have fixes that are public knowledge on the web.

Hope that helps,
73
Roy

Tom- I'd go for the 830. Have used one -still do- since it first came out - June '81 !! Mine has worked. I was off the air for 15 yrs or so, radio in box. Re-started the hobby, turned it back on, has been on since. I came up w/a 940, it's not 100%, but not as good as the 830...The 830 has a following, it does not have the bells and whistles, but it is EASY to run. Nothing to remember, which key-pad button runs what, no large display to sort out, no heavy thinking, just turn it on and go.

I have not had mine open. Output is still 100w +. I guess it will need tubes sometime, and I think about buying a spare set, but have not.

I recently picked up a Shure 444 mike at a meet, am told on-the -air that it sounds good, better than the MC-50 mike that "goes" with it.

Have run it into a Vertical, Inv.V, a trapped dipole, and now a Carolina Windom, with a tuner. Never any problem loading. I like the Windom, use the tuner on 160, and 75, to "trim' the ant. (it would/does work direct).

The only down side is the built -in speaker...it's 3 " I think...I have used a 4" spkr in the SP-940, currently use an Am-Com digital speaker, to cut noise. Can add more info if interested. (would do it different next time)

The 830's seem to go for $ 350 +/-. I don't know what the "Gold" model is.

I would say you could not go wrong in picking up an 830.

If more questions, ask.

73, Bob KA1DFO

Later 830's had the TS-830 emblem on the front panel with gold colored lettering. That's it. Same as all the other 830's. No reason to pay a penny more the gold colored printing.

I beg to differ...
East Coast transistor lists the TS-830S emblem as $4.55, the GOLD
emblem is listed at $5.04, so you are adding 49 cents more in value to
the TS-830S Gold versus the standard version.
Furthermore, the gold emblem is now a discontinued part, which adds
considerably to its collectability (maybe another $0.10 - $0.25)

....

True for any rig... use external speaker. I like the Drake MS-4 with a good radio shack 4x7 replacement in it, or any old boom-box speaker works great too.

958. TS-520/520S/520SE - 820 on WARC

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-11-22 17:42:07 UTC
From: falcon2448
Topic: 958 Message: 958

I've read a few post asking for info on converting these rigs to cover the WARC bands. I wonder if the conversion is worth the effort? Wouldn't it be better to purchase a used rig that already has the WARC bands built in in the event the conversion fails to work when completed? There are alot of used rigs that already have the WARC bands built in that are inexpensive as compared to converting a rig that wasn't designed to run on the WARC bands such as the TS-530S. I picked up my 530S for $250.00 on eBay and it works great on all bands including WARC. If the 530S hasn't had the diodes cut then it's a simple matter of doing so by following the simple instructions in the manual.

I know there are articles on converting these fine rigs to cover WARC bands however, does the conversion eliminate an already working band such as 15, for example?

Just a thought.

I, too, have used an 830 since 1981 and am still on the first set of tubes with full power out. For audio, I plug into the headphone jack, feed the audio out into an Autek QF-1a, the output of which goes through an AM-COM "Clearspeach" base unit that feeds a 10 inch speaker. Lots of volume, and I can use the headphones directly on the rig by simply pulling the plug to the Autek, or by pulling the plug from the 10 inch speaker and plug the headphones into the "Clearspeach" output. That gives the rig a "modern" digital audio system that really works great. I also like to turn and twist the knobs, watch the needles, move, and manually tune the antenna...no automatic stuff. Must be the old "broadcaster" in me. I would definitely recommend the 830s over the 530....no doubt about it!

From: ka9vaa
Topic: 962 Message: 962

I have used a 520se for years with a mc-50 mic, I have purdhased a ts-830 with a mc-60 mic. My question is, should I use the amp mic? or use the mc-50. The owner said to be careful not to over drive the radio with the mc-60 since it is very easy to do. In general should a amp mic be used with the 520-530-820-830 radios?

Your comments are needed please.

Thank you

963. Re: [TS-520_820_530_830] ts 830 mic question

From: w2aew@arrl.net
Topic: 962 Message: 963

In general, no - you should not need an amplified mic with the 830. The MC-50 was the mic of choice from Kenwood at the time for that rig. Either should work fine (simply turn off the preamp in the MC-60 if you choose to use that one). That's not to say that an amplified mic can't be used, it just generally isn't necessary. If you use an amplified mic, simply keep an watchful eye on the ALC and keep the mic gain on the rig low. A monitor scope can be very helpful to see if you are overdriving or not. 964. Re: TS-700 and 820S erratic internal VFO

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-11-26 21:26:05 UTC
From: falcon2448
Topic: 873 Message: 964

Thanks to everyone for their comments and suggestions.
Bent the VFO cap clip and cleaned the cap shaft and clip
where they meet and fixed the problem. Now the receiver
sensitivity needs to be fixed. I've adjusted the receivers
coil pack as outlined in the service manual and it improved
the sensitivity a good bit yet it still exhibits less
sensitivity than the 530 I have, about 2 1/2 S units less
than the 530 using the same antenna on the same band(s)
with the same signals same frequency. I've checked the
antenna change over relay and it appears to be in good
shape. I don't have the test/alignment equipment the
service manual calls for otherwise I would perform
the alignment myself so, for now, I'm at a stand still.
Any suggestions or where I can send it for repair/further
alignment?

To all my friends at Yahoo Groups.

Regardless of your faith, our prayer is for you and your family to be greatly blessed by God in this holiday season. May you all prosper in health, and see great miracles in your families and in our nations in the coming year.

We love you all.

73,

Bill and Bonnie Leahy
K0ZL, KB0HTC

From Luke Chapter 1 (nasb)
The Magnificat

46 And Mary said:
"My soul exalts the Lord,
47
And my spirit has rejoiced in God my Savior.
48
"For He has had regard for the humble state of His bondslave;
For behold, from this time on all generations will count me
blessed.
49
"For the Mighty One has done great things for me;
And holy is His name.
50
"AND HIS MERCY IS UPON GENERATION AFTER GENERATION
TOWARD THOSE WHO FEAR HIM.
51

checked all connectons..

freeze spray to large board chip ...display 57.185 or runs

up to 57.00000 from 33.00000

any ideas

thanks Rich

969. External VFO connector for TS-820

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-12-01 17:44:16 UTC
From: José Pedro Alvarez C.
Topic: 969 Message: 969

Hello all,

Thanks for the Holiday Blessings, I hope they reach all our list members and their families.

Regarding our beloved radios, the radio side connector of the external VFO of my TS-820 was recently broken.

I haven't been able to find the connector at all, it is so hard to find here that a previous owner of the VFO had the connector to the VFO side eliminated (now the cable enters the VFO back through a hole and is permanently connected).

Most of my operation is simplex to there is no real hurry in getting the connector but nevertheless I (and I guess most of us) like to have all my gear in working order.

So anyone knows where that connector may be found.

Thanks in advance.

I think these are the nine pin, bakelite plugs that look like a miniature tube base, no?

I have them here.

I have a 520se and have always loaded it by the manual. Bias set to 60mA, I have seen a number of places saying that the bias for the 830 should be about 90mA for full output, I wonder if someone could comment on this as I now have a 830 also, I thought the two rigs where pretty much the same when loading. Also the 830 manual says about 60mA.

Thanks for your comments.

980. Troubleshooting bad HV caps in the 520-830 series

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-12-03 15:23:50 UTC
From: Bill
Topic: 980 Message: 980

Since the High Voltage plate supply in these radios is a voltage doubler type, they can be tricky to spot if something goes wrong.

Since it is a doubler, it relies on the large black filter caps not only for ripple filtering, but also for getting a "leg up" on the desired plate voltage of 825 volts or so, depending on your line voltage.

If the set is blowing fuses with the TUBES OUT, suspect a shorted hi-v filter cap or two. Check them with an ohmmeter after everything has discharged. REPLACE BOTH CAPS if replacing one.

If the set shows low power output with known good set of tubes, or muddy TX audio, check the HV via the front panel meter. In SSB mode with no audio, note the HV plate voltage in TX mode. Then, reach around back and crank up the plate idle current to 150mA or so, or whistle up the mic (dummy load please!). If the plate voltage drops to less than 700, or about 20percent below the no-modulation voltage, you may have bad filter caps. Hey it's time to change them anyway.

Kenwood has obsoleted these. They wanted too much anyway.

I get mine from Digikey, p/n P7453-ND

they are same diameter but about 1" tall! Don't worry, they work just fine.

While you are at it, replace the 470K ohm, 1/2 watt carbon bleeders with same value, metal oxide film resistors. Also the little disk caps... I use 0.01/1kV jobs.

Also lift the rectifier unit and check for bad solder joints.. this board subject to lots of heat; resolder anything that looks remotely wierd. Except yer thumb of course.

Bill

I have an old R-1000 general coverage receiver that has developed a problem with the fluorescent frequency display...essentially only parts of each digit are displayed. The service manual indicates the 'tube' part number is V40-7770-06, called an "indicating tube" 5-BT-05. Since I can't find evidence this tube is currently available, is anyone aware of repair shops that have either a good inventory of older parts, or can suggest a modification to use another type of frequency display? The receiver still can be used with the analog tuning...but comparably inaccurate. Thanks in advance.

From: Jim
Topic: 984 Message: 986

I have hooked up my TS-820 to a sound card which is pretty much the same process. I built a level converter using a schematic I found on the ARRL site, only to discover that I really didn't need an interface at all. Just go down to Radio Shack, buy a couple of RCA to mini-plug adapters and a couple of mini-to-mini patch cords. Insert the adapters into your Phone In / Phone Out jacks, run the patch cords to your PC, and away you go. I run PSK and RTTY using this setup with nothing extra needed.

The trick to making this work is to make sure you have the sound level adjusted properly on the PC side. If you are a Windows user, this is done with the little slider controls on the task bar. You have to be careful to adjust the level so that it engages the VOX but not so high that it overdrives the software you are using. Fully plug and play compatible; just plug it in and play around until it works!

Somebody asked this same question about a month ago, you might have a look at some of the earlier responses in the message archive. Good luck.

73,
Jim

Tim, since most all of the interfaces you see work from the external speaker connector on the rigs, it will work with the TS-520 on receive, same as the other rigs.

For tx, use the phone patch input on the back of the 520.

Any time you connect a rig to your sound card it is wise (very wise) to use a 1:1 isolation transformer. In some cases you prevent a ground loop and hum that can result in poor performance. The main reason is the protection of your sound card from static and/or spikes that can damage it.

Mike

996. TS820S VFO Drift.

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-12-07 01:43:09 UTC
From: ab8pk
Topic: 996 Message: 996

Hello and Happy Holidays to all!
I have a TS820S with VFO drift. She will rise and fall a couple of hundred HZ every so often but it is getting worse! Any suggestions? I leave this rig on constantly with the heaters off to avoide the warm-up period. If I shut her down, the first hour the VFO is all over the place. She used to settle down to her rock solid self. No more "rock solid" even when she is left on! Also, I want to get a nice desk mic for this rig but have not been able to find the old MC-50 at the Hamfests or anywhere. Anyone have a opinion or recommendation on a mic for this rig? Thanks in advance!
Regards,
Mike ab8pk

Mike,

Actually, I found I had more hum problems with the transformer in line. I don't know whether it was my construction technique, or something else that I am overlooking but I quit using the circuit I built because it caused me more problems than it cured. What do you think the cause of the hum would be?

73,
Jim

---> My reply to what Jim wrote 12/6/2003 7:58:29 PM

Jim, there should not be any hum introduced by a simple 1:1 isolation transformer (600 ohm). On the receive side of things (audio out from your rig to your line in) all you need to do is make sure you are using the correct taps on the transformer, The Primary side goes to the 'line in' on your sound card, the secondary goes to your radio. Use good shielded audio cable on both sides of the transformer (short as possible) and I always toss a ferrite core for RF suppression on the line just before the sound card..

Not every installation has a problem with a ground loop or hum but every installation without a isolation transformer has the potential to damage primarily the sound card. There are a lot of people who get by with direct connection but then there are a lot of people who have had to replace their sound card.

On the audio in (from the sound card to the mic input of the rig) most of the time you will have to attenuate the voltage from the sound card and use a 100:1 attenuation. You should still use a 1:1 isolation transformer here but add a capacitor and resistor for the attenuation. Here again put a ferrite core on the line just before the soundcard.

If you use PTT (and not vox) you should use a optocoupler to isolate.

In all these lines, good quality, shielded audio cable is important. You should keep your cable as short as possible and pay attention to the routing of your cable (keep it away from RF as much as possible).

Again, if there is no ground loop and hum a lot of people get away without isolation but it really is wise and not very expensive to do it right. I would be interested if you take a look at the interface you built with the above information in mind to learn what you find. There should be no reason for hum to be introduced (that I can see) with these ideas. I would also look to see what is causing the hum (interference) because if it is getting into your audio in this project it could also be causing you other problems.

One last thought, if you have to, you may put all the components into a metal box and ground it with only the shielded cables (grounded at the point they exit the metal box) outside the box. In most cases this would not be needed but could help in a pinch.

I hope this helps.

Mike

You stated the VFO, when the 820S is shutdown and then
powered on, is all over the place. I assume you are
saying when it's just sitting, not being tuned. If
not then it might be the spring tension on the VFO
capacitor. I had the same problem with my 820S VFO
when turning the knob. The external VFO was fine.
Removed the VFO and it's outter metal cover and bent,
slightly, then cleaned the connection between the spring
and the VFO cap and that fixed the erratic behavior.

Not sure if this is your problem since you didn't state
whether it occurs when turning the VFO knob.

The Rascal is an inexpensive interface that should
work fine with the 520/520S/520SE. These
rigs has the patch in/out connections on the back
and you can use VOX to key the rig. If you want
PTT then an additional connection will have to be
made using the Rascal OPTO isolator circuit. I have
one of the first Rascal interfaces, don't care for the
heavy cabling, yet it works just fine on RTTY, SSTV
and PSK-31 to name a few with my Kenwood and Yaesu rigs.

If I am working a guy and it seems like he needs just a bit of a "pull", I will pick up the CHARACTER speed but leave the word spacing where it was.

Share a story with ya:
One morning, got off work from my gyd job, had a brewski and got on 30M... ran into a friend of mine, Jim W0CML, on his way to work. We started about 25wpm... Jim is a high speed operator and we have spoken many times in person and on 2m so I know what he "talks like"... I finally put down my pen, sat back in the chair and started to LISTEN.. when we finished up, he was at work and I was at 35 wpm. Just like that, one QSO.

Apply the same percentage to 5 wpm, you get 8-9 wpm... 10wpm? 13! 15 will get ya 20.

Another trick: do field day. CW. Log. Log for a cw op. soon you will start hearing the calls, maybe better than he or she does... as was my case. I started picking the calls out of the clatter (NO CW FILTER on that rig!) and the op saw that. Soon he turned the key over to me, and I was working them! I came into that field day at 8 wpm and went out at 13++! I went right down that week and took the 13 wpm and the general. The fcc guy (we had to go the offices then) said, "why not take the Advanced too, you might pass it", and I did, and I did.

Novice to Advanced in one week, because of a contest.

73 all,

Bill K0ZL

Normally when I am on you can find me on 20 or 40 meter in the digital bands
but mostly go to 40 meters for CW.

---------- Original Message ----------

What bands do you have up?

I can do 40, 30, 20, and 10M. Probably 17 also

Hi all

I struggled through 20 WPM for my extra exam and had not done any on the air CW up to that point. I, like many I know, thought once I got my license I would never use CW. Boy was I wrong. I had been participating in a club that runs worked all states nets in most all the modes. I had been on the SSB nets about a year when I got up the courage to try the CW nets. What I found was the net was a less threatening way to build up confidence and speed. The exchanges mostly consisted of call signs signal reports. (just like a contest but less frantic) It doesn't take long to get real good with those. The object of the nets is to make contacts and exchange QSL cards. (We even have a free QSL bureau to handle the exchange of cards. All one has to do is keep a few SASEs in the bureau) The net control stations are usually very patient especially with folks new to code and will respond at the speed someone checks in at. Sometimes it is hard for new stations to comprehend the up and backs but when the new station is called everyone slows down for him. Great way to ease into CW without having to hold long QSOs. There's also several of us that will send info on the Q signals used and such. From there I joined FISTS and my code improved greatly. Info on the 3905 Century Club CW and other nets can be found at www.3905ccn.com. We have CW nets on 20, 40 and 80 meters.

If you have any other questions pse contact me off reflector and I will try to answer them.

From: David C. Williams
Topic: 984 Message: 1014

I had a hum when I connected the phone patch out from the ts-820s to my soundcard. I found that if I plugged in just the tip of the RCA cable, the hum went away. So to test it I took an old rca cable and cut the shield around the center insulator leaving the center intact. I then simply used an RCA to 1/8 mini converter to go into the soundcard. The hum went away. Not sure why. I then tested the conductivity between the center conductor and the case of the rig, BEEEEEEP! Why would the center conductor be connected to ground? Something wrong inside maybe? But the signal is clear as a bell with no hum with the shield disconnected. I suppose I need an isolation transformer but just thought I would throw this out there.

Subject: Re: [TS-520_820_530_830] Re: Sound Card hook up

---> My reply to what Jim wrote 12/6/2003 7:58:29 PM

Jim, there should not be any hum introduced by a simple 1:1 isolation transformer (600 ohm). On the receive side of things (audio out from your rig
to your line in) all you need to do is make sure you are using the correct taps on the transformer, The Primary side goes to the 'line in' on your sound
card, the secondary goes to your radio. Use good shielded audio cable on both
sides of the transformer (short as possible) and I always toss a ferrite core
for RF suppression on the line just before the sound card..

Not every installation has a problem with a ground loop or hum but every installation without a isolation transformer has the potential to damage primarily the sound card. There are a lot of people who get by with direct connection but then there are a lot of people who have had to replace their
sound card.

On the audio in (from the sound card to the mic input of the rig) most of the
time you will have to attenuate the voltage from the sound card and use a 100:1 attenuation. You should still use a 1:1 isolation transformer here but

add a capacitor and resistor for the attenuation. Here again put a ferrite core on the line just before the soundcard.

If you use PTT (and not vox) you should use a optocoupler to isolate.

In all these lines, good quality, shielded audio cable is important. You should keep your cable as short as possible and pay attention to the routing
of your cable (keep it away from RF as much as possible).

Again, if there is no ground loop and hum a lot of people get away without isolation but it really is wise and not very expensive to do it right. I would
be interested if you take a look at the interface you built with the above information in mind to learn what you find. There should be no reason for hum
to be introduced (that I can see) with these ideas. I would also look to see
what is causing the hum (interference) because if it is getting into your audio in this project it could also be causing you other problems.

One last thought, if you have to, you may put all the components into a metal
box and ground it with only the shielded cables (grounded at the point they
exit the metal box) outside the box. In most cases this would not be needed
but could help in a pinch.

I hope this helps.

Mike
---------- Original Message ----------

Actually, I found I had more hum problems with the transformer in line. I don't know whether it was my construction technique, or something else that I am overlooking but I quit using the circuit I built because it caused me more problems than it cured. What do you think the cause of the hum would be?

73,
Jim

1016. TS-700SP Repeater switch

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-12-09 12:21:04 UTC
From: falcon2448
Topic: 1016 Message: 1016

My TS-700SP all mode repeater function doesn't work
properly. First, let me say the TS-700SP works when the
"REPEATER" switch is in the "OFF" and "REV" position and
has power output. However, when the "REPEATER" is in
the "NORMAL" position there is no power out, none, zilch,...

In CW, SSB and AM, there's good power out and is adjustable
using the front panel gain control in the upper right. This
control also varies the output when in FM "OFF" and "REV" as
well.

I checked the Low/High power push button on the front panel
and in either position, FM "NORMAL" produces no power out.

Inside, top/front of the main board are 2 rows of crystal
sockets. The one on the left is for the "FIXED" position
switch and the one on the right, I assume, and we all know
what "assuming" does, are required for proper operation of
the rig although they are not described in the pdf copy of
the manual I have. The schematic, very very poor quality,
doesn't show them or at least I can't find them. The manual
doesn't indicate what crystal is to be in what socket on the
right either. I'm not the original owner so I can't say
that the "NORMAL" position of the "REPEATER" switch has
ever worked or when it stopped working. I can't hear
anything on my handie when dialing up, on my handie,
the -600khz frequency when the rig is in "NORMAL" FM
repeater mode. I can, however, hear the rig when it's
in "OFF" and "REV".

Receive works fine in all modes, exactly the manual, what
parts I can read, says it should. I'm thinking it's either
a switch problem or one of those crystals on the right side
of the main board. Any ideas???

Also is the meter suppose to indicate power out? There is a
picture in the manual that indicates it should give an
indication of power out when keyed. There's a scale
on the meter for it yet when there is power out the meter doesn't
indicate anything, stays to the far left of the meter scale.
The only indication I get is on the SWR meter I have between
the rig and my dummy load. The meter works fine in receive
and/or center. In receive, depending on the meter switch position,
it functions properly, received signals, depending on their
strength, shows and indication as does the "CENTER" mode for the
meter.

I do not have the remote VFO, only using internal VFO with plug on the back of the rig. The plug came with the rig so I'm not sure if it's the right one.

Your statement >"In CW, SSB and AM, there's good power out and is
adjustable
using the front panel gain control in the upper right. This control also
varies the output when in FM "OFF" and "REV" as well."
There is no front panel gain control in the upper right to adjust output.
Upper right control is "drive" and should always be adjusted for maximum,
as you move around the band. Power output is either, high or low, and
it's controlled on the front panel by the push button to the right of the
meter.

The crystal socket on the left holds crystals for any of the 11 positions
controlled by the front panel "fixed" switch. They normally come with no
crystals installed from the manufacturer. The 6 crystals on the right
control the various band segments, 144, 145, etc. as the "band" switch is
turned and repeater offset. The crystal info for both is shown on the
left side of the schematic sheet, on HET UNIT (X50-1410-11) drawing. The
11 position diagram is directly below this drawing and the band switch
diagram is left of this drawing. Repeater offset crystal, one of the 6
mentioned above, the repeater switch, or more likely, the RL1 relay,
would be the first places to troubleshoot. The relay is a 6 pole double
throw and source of many troubles.

When transmitting, RF power should be viewable in all modes on the meter.
Check diode D10 and also VR3 (power output meter adjustment) on the RX NB
board(X55-1210-00).

Corky,

Yes, thanks for mentioning that. That inspired me to visit the Caig web site and it looks like the "mini-spray" kit is the way to go. For those that have not been there, the manufacturer offers a kit with Deoxit, Cailube MCL, PreserveIT, and ProGold for about $22. Should be just what I need, so thanks for passing along the suggestion.

And thanks to Bill as well for starting one of the more useful sites on Yahoo.

73,
Jim

My 830 out put has dropped to 15w on 17m to 45 on 80m, I would like to replace all tubes in it but I am worried about the neutralization of them. I do not have a rf volt meter I do have a 820 and a 520 I could use as suggested in the manual to tune to a minimum s meter reading although I have read this is not the best way , has anyone tried it using a receiver? I also read a vtvm can be used with a rf probe and a probe can be made easily from a few parts, only I can not find a schematic for one, any suggestion?

Thank you for any suggestion.

Here is how you test your tubes:

First, in SSB mode, no mic, key up and adjust the idle plate current up as high as it will go. You should be able to see at least 150 mA. Then watch it for 3 seconds only.

If the plate current stays steady, you have good finals.

If the plate current comes up then drops off by itself noticeably, or if you cannot get past 150mA, you have bad finals.

Reset plate current to 60mA (I use 35-45 mA but that's just me).

Now, tune in TUNE mode; peak the driver for max ALC reading, reducing CAR as needed to keep ALC reading on-scale. Unkey for few seconds. Key up again, and watch the ALC reading. If it comes up, then stays there, the driver is OK. If it comes up then drops off noticeably, the driver tube is bad.

If the tubes check OK and you still only have 15 watts out, (what band?) you may just need an alignment, or some other component has failed.

To neutralize, all you need is dummy load and insulated screwdriver. The neutralizing cap will have the plate voltage for the PA tubes on it so be careful.

TO CHECK NEUTRALIZATION:
Tune for max smoke on 20m into dummy load. Switch meter to plate current and watch the dip as you rotate the PLATE tuning control back and forth. The plate current should rise smoothly on either side of the dip, to about the same level either side (reduce CAR control as needed to get the "headroom" you need). Also, watching the power meter on the dummy load, the max output should coincide with the plate current dip. If it does, leave it alone.

TO ADJUST NEUTRALIZATION:
Remove the covers for the rig, and located the neutralizing cap, just ahead of the PA section tube sockets. It will be an air variable. Find an INSULATED screwdriver; the cap will have 800 volts on it. Use heat-shrink on the shank of a screwdriver or use a stout plastic one.

Tune rig for max smoke into dummy load. Check neutralization as before, rocking PLATE control back and forth and noticing both the plate current swing on either side of resonance and max power output tuning point. Unkey, and carefully adjust the variable cap one way or the other. Key up and check again; if the problem is worse, go back the other way on the cap. If it's better but still needs more, give it more movement that same way. When the plate dip coincides with max power output, AND the plate current rises roughly equally on either side of the dip, you are done.

POSTSCRIPT:
Some 12BY7's exhibit instability in some rigs. Check by tuning the rig for max smoke on 10, 15 and 20 meters (need to check all three). Rock the DRIVE or PRESELECT tuning control all

the way from one end, through resonance, to the other. Then go back the other way. Plate current and power output should smoothly increase towards resonance, then smoothly decrease, same thing when moving the control the other way. If you notice ANY instability on ANY band, replace the driver tube and realign the RF deck. SAVE tho tube that was unstable... it can be used in another rig!

Stock up on 12BY7's... believe it or not, lightly used ones are better stability-wise than NOS. I don't favor any particular brand; I have seen unstable tubes from all manufacturers in many rigs, replace the tube, use that tube in yet another rig, everything is fine. The BEST 12BY7's are the ones that Tektronix used in their boat-anchor scopes. You can find these on eBay from time to time.

Use only 6146B tubes in these rigs; they have 35 watt plate dissipation ratings, vs. 25 watts for ALL OTHER 6146 versions (even the W's--don't let the ads fool you). You CAN run 6146A or 6146W tubes, but they will only last ten years, not fifteen. :)

73,

Bill

Locate the neutralizing cap, some rigs it requires removal of the PA cage; on the 520-830s, you can get to it from underneath I believe.

Yesterday I relamped my R-820 and, at the advice of a friend, I used model railroad lamps. The friend, a longtime owner of a TS-830, insists that they last longer since they are rated at a slightly higher voltage (16v). However, the new lamps tend to flicker when a strong signal is swinging the S-meter on CW. I am assuming this is not good. Is the best to go back inside and replace these with the 12 or 13.8V lamps from Rat Shack, or is something else causing this problem. All I did was relamp it, honest :-).

Also, does anybody have a link to a scanned service manual for the R-820? BAMA doesn't have one and I have not seen one anywhere else. In the alternative, can somebody tell me which dip switch on the filters board is number 1 and which is number 9? Even though the seller swore the R-820 didn't have any filters installed, Santa came early this year and it seems the entire board is filled with all the original Kenwood filters. However, I suspect the switches are set in reverse order from what they are supposed to be.

Merry Christmas to all.

For those interested in slow speed CW, there is a
group here on Yahoo called QRS-CW, or CW-QRS.
One of the guys has set up a website for live
spots, & sked setups.

It's a solder-in filter, if you use the stock Kenwood filter. If you buy an Inrad, you may have to mount it off the board and use sticky tape and short length of coax to connect to the IF unit.

Hi Bill thank you for your reply. i have a couple of questions.I think i read somewhere that if you do not fit a ssb filter that you can fit two different cw filters.In the handbook it states that the cw filters for the ts530sp are YK-88C 500 Hz and yk-88cn 270hZ . I have found two filters advertised but they are YK-88C-1 and YK-88CN-1 will these work in the ft530sp or not.Any advice would be most welcome. All the best from Nigel

No Nigel, the -1 are for the 450/690/850/570 series of radio. slightly different if freqs.

YK-88C or CN only sir.

Get the 270.. you will enjoy the added selectivity if you work a lot of CW

If you are just a casual operator and not doing ANY contesting at ALL now or in the future, get the 500... easier to tune.

Topic: 1036 Message: 1036

Hi gang,

I'm not officially a licensed ham yet, but will be within 3 weeks or so. With costs of radio equipment being what they are, and having to live on a budget, I am forced to look at the older used radios. I noted with some amusement on the Eham reviews that many of the "older" radios are getting better reviews than many of the newer models released within the past couple years.

My personal focus is on the Kenwood ts-520s, for three reasons: 1. I understand it has its own internal power supply; 2. It appears to be built like a tank (good for camping), and 3. The cost factor. They seem to go for around $300 on Ebay. (I realize I need my General ticket to operate HF. But it doesn't hurt to start doing my homework in advance. As for working with my Tech license, I'm going to get a Yaesu ft-8800 to cover that gap.)

Regarding the ts-520s,I have a couple of questions:

1. When a radio has an internal power supply, does that mean it has plugs/prongs for plugging into a wall outlet at home?

2. As this is an older radio, are there any sources of parts for this rig, in case the one I buy turns out to need some work? Is there anyone out there who works on these older radios?

Thanks in advance for your input!

Jody

hi Jody the ts530 is a brillient radio but i would say that it was for use at home it is a little large for taking camping and weighs quite a bit.i would not swop mine for home use i love using it. a cheap radio that i pick up for camping is a yaesu ft7 still large compared to mobile rigs today but a good compromise it runs off of batteries or power pack.i think others will probably let you know about spares and repairs. so in my opinion for what it is worth the ts530 makes a great base radio but you will have to tune it properly.i am sure someothers will give you more useful answers. all the best from Nigel

Jody:

I took approximately the route you plan. I bought a TS-820 with external VFO on eBay for $275, and an MC-50 mic for another 60 or 70. Both have given great service.

Have you thought about getting a tech plus license and using CW until you can get your General ticket? I use CW almost exclusively, not because anyone's driving it down my throat, but because I prefer it.

In answer to your questions:

1. When a radio has an internal power supply, does that mean it has plugs/prongs for plugging into a wall outlet at home?

Yes. The 820 and 520 plug right into your wall outlets. The 440 needs an external power supply.

2. As this is an older radio, are there any sources of parts for this rig, in case the one I buy turns out to need some work? Is there anyone out there who works on these older radios?

How about Kenwood for service?
http://www.kenwood.net/?do=ServiceCenters

You could also look around the net for reviews of places like Avvid and Groton Electronics.

Hope this helps!

Ken

Subject: [TS-520_820_530_830] New to list and have questions about the ts-520s
Date: Tue, 23 Dec 2003 00:53:50 -0000

Hi gang,

I'm not officially a licensed ham yet, but will be within 3 weeks or so. With costs of radio equipment being what they are, and having to live on a budget, I am forced to look at the older used radios. I noted with some amusement on the Eham reviews that many of the "older" radios are getting better reviews than many of the newer

models released within the past couple years.

My personal focus is on the Kenwood ts-520s, for three reasons: 1. I understand it has its own internal power supply; 2. It appears to be built like a tank (good for camping), and 3. The cost factor. They seem to go for around $300 on Ebay. (I realize I need my General ticket to operate HF. But it doesn't hurt to start doing my homework in advance. As for working with my Tech license, I'm going to get a Yaesu ft-8800 to cover that gap.)

Regarding the ts-520s,I have a couple of questions:

1. When a radio has an internal power supply, does that mean it has plugs/prongs for plugging into a wall outlet at home?

2. As this is an older radio, are there any sources of parts for this rig, in case the one I buy turns out to need some work? Is there anyone out there who works on these older radios?

Thanks in advance for your input!

Jody

Improvement ranges from noticeable to "why didn't i do
this sooner?". I have installed many Inrad filters
and they are always worth the time and effort.

I would trust the Inrad evaluation. Ihave seen those
soldered in place, and yes they are larger but they
will fit.

I had to install some in a TS-870 and had to stick the
filters to the chassis inside; then wire in with coax.
Not too hard to do, inrad gave us coax but no sticky
tape. I used "shoe goop", kinda like a super rubber
cement, and also adds some shock protection to the
filter as it stays a little compressible after curing.

Dear Jim,

If you find the Service manual for the R-820 Please let me know. (I only have the Operator Manual, in case you need it)

About the lamps, if you use any of 12-13.8V you better use a small resistor is serie (to protect the lamp...) It has worked to me in the Ts-820 and in the R-820 for years.

Regards,

Eduard (YV5GRB)

1051. 520 drifty VFO advice ...

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-12-23 18:15:21 UTC
From: Herb Lober
Topic: 1051 Message: 1051

Hi there,

The freq stability on my trusty old 520 became a sore spot with my rag chew buddies ... seems like they were wearing out their finger tips trying to keep up with my driftyness. I did some experimenting and it really was drifting all over the place ... even after an hour or so of warmup. It also would jump about 5khz from time to time.

Unfortunately I read the cleaning advice for the VFO on this site only today. I will do this when I get back to the radio.

Last week I checked the mods.dk site and it said to change out C6 and Q1 in the VFO unit .. so I did (BTW ... most of the MOS-FETs can be replaced with an ECG221 if you can't find the exact replacment part). During my foray into the radio I was extremely impressed at the mechanical and electrical build quality of this radio.

The problem now is that I have no receive at all ... just hiss. I have double and triple checked all the connections and it all seems intact. I do not have much for alignment tools, but I do have a frequency reader and an RF adapter for my digital VM. I'm going to poke around some more tonight, but I'm wondering if anybody has ...

-general advice about this, or ...
-a higher quality scan of the transmitter and receiver level diagrams that shows the voltage levels legibly.

Cheers and don't have too many egg-nogs.

Herb

Thanks for the offer of the manual Eduard, but I have an original manual. Somebody else replied to my problems on the lamps and it looks like I will be back to the other style. No luck yet on the R-820 service manual.

BTW, does your TS-820 have the full transceive mod? Is it worth the effort to mod the rig? I fabricated a connecting cable (after finally finding the connector!) and it seems to work, but I have not had the courage to start chopping wires on the mode switch just yet.

73,
Jim

the 230 is a digital readout. They are somewhat easy to find on ebay, but
you are better off on QTH.com--a good one can get salty, but that dx card
makes up for it! (and you can even work 40m phone in the contests with it)

About four years ago, I paid 175.00 for one at Dayton. That was as low as he would go. On eBay prices tend to get a little inflated just because of the nature of the beast. i.e. last minute bidding wars. You will find that on QTH.com (or eham, qrz, etc.) you can deal direct with the seller or advertise yourself for one and get it at the right price. Whatever you get make sure you have digital readout. It's hard to go "up 2" on an analog dial.
Merry Christmas ;
Dale K9TTT

BTW: I have not looked lately, but to get an idea of what you should be paying, check out the used equipment listings for major amateur radio dealer such as AES and Burgthart. That will give you an idea of market value. Buying from an individual should be less than what they are advertising for.

Did you clean the wafer contacts of your bandswitches in the rf cage? They
are dis-simular metals and sometimes don't make good contact. Also check
the bandswitch it's self. It has a tendency to crack and might not be
switching. Just a couple ideas from when I had to have mine repaired.

I may have found the trouble, I remember Bill saying that the 12by7
driver tubes sometimes do strange things, I changed it and now it
loads all bands. I don't understand why or how it could load all
bands but 10 meters.I'll let you know if it keeps working.

Thank You

Certain tubes have characteristics that will fight you
in certain rigs.

Don't discard that tube; give it to someone else, warn
them it may or may not work.

Don't discard any 12BY7 tubes unless the ALC
indication drops dramatically after being keyed up
(assuming you have alc indication to start with).

1062. R-820 receiver problem

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-12-27 14:13:23 UTC
From: yv5grb
Topic: 1062 Message: 1062

Dear Friends,

I inherited (a present from a VE ham) a R-820 receiver but so far I am unable to put it to work...It presents two problems, may be interrelated:

- It do not receive.
The Af and Rf control seems to work, also there is a difference between AM/CW/SSB, but no signal is received, and VFO selectivity do not work same as Calibrator signal is never heard.

- Only one digit on the digital screen.
A "0" (cero) appears on the middle of the screen, thats all.

I have been checking every circuit for visual damage, checked some voltages but everything looks great...I'm not trained in electronics (but it is fun), Im an architect...So I will verry much appreciate some help.

Thank you

Eduard

Bill K0ZL,
I don't know much about the R820, but did the R820 have a plug that was required like the TS820 (9 pin plug) where the external VFO would connect... possibly the R820 was used as a slave to a TS820 or other radio, thus no plug???

Dear James,

Thank you verry much for your interest and reply.

When I first received the R-820 I looked at the back...but no 9 pin
socket like in the TS-820.

Thanks again,

Eduard

1065. Re: R-820 receiver problem

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2003-12-28 14:48:31 UTC
From: Jim
Topic: 1062 Message: 1065

Eduard,

Lets see if I can help a bit. First, this is a great radio once you figure out how to use it, so be sure and thank your friend. As for your problems:

1. The problem with the digital display is probably oxidation on the connector. This is a well known problem on these radios and the fix is easy. Open the top of the unit, carefully wiggle off the white connector (on the top, middle of the rig, towards the left side of the chassis as you face it), and clean it. As for what to clean it with, if you read back a few messages you can find a discussion on this topic as to which product is best, but they all come from CAIG Laboratories. If you don't have a local electronics supply house that carries these products, you can buy the Mini-spray essentials kit from here:

http://shopping.netledger.com/s.nl/c.ACCT113328/sc.2/category.20/.f

Clean the old junk off with DeOxit, and then treat it with Cailube and PreseveIt. Clean both the pins and the plastic connector, just a light spray will do. Then just slide the connector back on and you are probably going to be in good shape. I did this to both my R-820 and TS-820 over the holidays and it cured them both. Sometimes just sliding the connector off and on will loosen enough oxidation to fix the problem, but if you want to do it right clean it with DeOxit.

2. As for your Rx problem, you are correct that there is no 9-pin plug on the R-820. Have you plugged in a speaker? Unlike the TS-820, there is no internal speaker on the receiver so you need either an external speaker or headphones if you want to hear anything.

Make sure the rotary switch next to the S-meter is in VFO position, crank RF gain and AF gain up to appropriate levels, and set RF Att to 0 db (you probably already have). Make sure the transceive switch to the left of the power switch is down (set on SEP). There are two band selector knobs, make sure the one on the right is set to "Norm", and set the other one to a band known for a lot of activity, like 20m. Play with the Preselector knob to maximize the white noise in the rig.

From this point, I am going to have to guess on the right VBT tuning. The rig comes with various combinations of filters and the bandwidth is adjusted by the two knobs on the VBT shaft. I have all the filters in mine and find that the CW filters are so narrow, I can often tune in nothing at all! Exactly how wide the passband

will be depends on which filters are installed and how you have the center and outer knobs set. The range is 150 Hz to 6 kHz so it is easy to have the passband too narrow.

Rotate the center VBT knob all the way clockwise to open the passband wide, and then try a few position on the outer knob. Auto is supposed to select the best filters for the mode selected, but I prefer to manually select the filters. Just play around with some of the wider settings (2.4kHz, 6kHz) or Auto as you tune around looking for a SSB signal. The CW filters can be VERY NARROW and it is easy to tune past everything, so try with SSB and go from there. Also, if you have all filters installed and set the outer knob to 250 Hz position, the tuning does not work properly (this is a Kenwood "feature").

I hope one of those suggestions helps.

73,
Jim

Are you referring to bandwidth?

The 820 comes stock with a pretty good filter; maybe
someone removed it.

There are extra filters you can buy which I highly
recommend; that is the line carried by InRad.

I don't recommend going below 2.1Khz unless you are a
hard and fast contester... any narrower will not sound
well on receive.

Dear Jim,

Thank you for the nice explanation, and for your dedicated interest.

I read all your text and printed it for further use (hope so).

Jim, I own a TS-820 for years,... and when i used to live in Maracaibo the humedity whas so high that i had to clean the contacts once every three months,... here in Caracas i do it every 5 years, hi hi, so this is a known problem in the 820 series. When I got the R-820 from my friend he told me about the two problems,... he knew how to use it, I had to learn, because in the beginning I only saw a TS-820 in it and my fingers went the wrong way, now i have taken all the boards out one by one cleaned them, visually checked and and also checked some voltages, every thing seems fine but... no digital output and no signal reception, (even no calibrator signal !!!!) I explained that in my first email. so I am still searching,.. hi hi.

I've send the receiver to some technicians down here in Caracas but they say they do not mess with old equipment!!!! So i have to do it 'with a little help of my friends' hi, hi, in the same way I fixed the SM-220, two old ATLAS 210X, and a Yaesu FT-7B.

Best regards and wishes for the comming 2004

If you run lamps much below their rated voltage, the temperature goes down (saves the filament), but the sensitivity to small voltage fluctuations goes up. You can see this with home lamp dimmers, too. I'd guess you are seeing normal voltage fluctuations that were not visible with the normal lamps. Probably nothing to worry about.

Eduard,

Sorry my suggestions did not help the problems much. If you think the voltages are OK, I wonder if you have a component failure on the digital display? Bill would be a better one to give a diagnosis than I, since I know just enough about electronics to be dangerous. If you have cleaned it all, there must be something more complicated going on. Best of luck to you.

73,
Jim de K1ZC

Martin,

Yes, another member replied to me and suggested that I was just seeing a voltage drop due to the lamp, which is what I suspected. However, I couldn't stand using an R-820 that blinked in rhythm every time somebody sends CQ in code (you semaphone fans might like the effect though). So, I relamped it on Christmas with 12V bubls and all back to normal.

73,
Jim

1073. Psk on TS-520

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-01-01 10:23:20 UTC

Topic: 1073 Message: 1073

I've just read through the posts about hooking up a TS-520 for psk
and now I'm confused.

I read the post about using the phone in / out jacks and that seems
simple. But the last time I used my 520 on psk I ened up blowing the
fuse. At that time I used a homebrewed interface.

So I guess what I am looking for is "how do I set it up?", from
beginning to end.
Thanks in advance.
Hal

In answer to your second question...i.e. parts availability, the most attractive feature of the 520 series is the ease of "do it yourself" repairs. The circuit boards are huge, and most of the parts are easily replaceable. On the other hand, when I bought mine on "ebay", it smoked when I first turned it on. Checking with a couple of repair facilities I was shocked at what they wanted to service it. ($75 an hour on up.) Worse yet, they all have a one to two month turnaround time. I found the problem and repaired it myself in about an hour and a cost of $12. (part of the power supply). Great rig now. Has great reciever in it.

Good luck and go for your general ticket.

A lot of talk about getting repairs from facilities like kenwood and some of the other places whichich charge an arm and a let. Try this one guys:
www.qtm.net/~sarts/sarts.html
Does excellent work, fast turnaround, (no month) and great guy to work with. All your questions can be answered on his web page. (including bench rate)

Cheers, and Happy New Year
Dale K9TTT

1076. TS 830S frequency display problem

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-01-02 10:55:09 UTC
From: k2uod
Topic: 1076 Message: 1076

Fired up the 830S last night and had an unusual problem. The display reads 1 MHZ down across all bands. Example: set bandswitch to 7 MHZ; display read 6.040 MHZ; 14 MHZ read 13.040 MHZ, etc. Was actually recieving 7.040 and 14.040.

Any ideas?

73, Keith K2UOD

There is a PLL that acts as a tracking generator for
the counter and it follows the VFO... I suspect that
it is unlocked?

Hi Hal,

I use the rascal interface kit from buck at http://www.packetradio.com/
lots of info there for you including psk31 info.

The interface isolates the radio from the pc with optoisolators and
matching transformers. The interface connects to the mic connector
on the radio for transmit and uses speaker output for reception.

You can enjoy psk31 reception right now without any interface,
just run audio from the speaker out from the 520 to the input
on your sound card. Be sure to turn the radio volume way down
so you don't overload the sound card on the pc.
I use digipan but other software works great.

You may have to adjust the line in settings for the sound card
in the sound card utility panel in windows o/s.

Hope this helps.

Hi Hal,

When you use psk31 important to keep the output level down to under 50 watts or even less then that. There is an external circuit (9v battery and a pot) that you can use with aux socket on back of the radio http://www.mod.dk it is the ts-520 qrp mod.

For the radio settings, same as using ssb but you need to reduce the power output by using the above circuit.

Just bought my self a TS-530S ,all appears well with it.Good 100watts out ,good rx etc.
What concerns me is the reliability ,such as the high voltage electrolytics,valves etc.
Is there anything I should keep my eye on,should I aquire spares etc.
It will get quite a bit of use.
What are peoples experiences with the set.
I am sorry if the question is a bit watery but any comments will be appreciated.
Regards
Bob/G7JHW

The high-voltage filter caps can use replacement on
all of these now.

I use the Nichicon caps sold by Digikey,
www.digikey.com, P7453-ND.

The others can be replaced also; the minus bias
supply, the 350 volt screen supply, the 13vdc supply
and the audio output blocking cap.

I am thinking of putting together "cap kits" that will
allow owners to re-cap the vintage rigs, without
having to hunt up parts, parts that won't fit
physically etc.

As for valves, yes by all means, find a set of 6146B
only (not W or A or plain 6146), either GE or RCA, and
put them in for test. If they work, put them on the
shelf for spares and put the old ones back in.

Driver tubes also. The best are the ones used in the
Tektronix scopes and pulled as part of a maintenance
plan... these are often available on eBay as pairs for
about 14-19 USD each. I like the scope pulls because
they tend to be very stable and have much life left in
them.

Just to add to Bill's comments;
I've had a 530s for abt 4 years now (Ham Fest buy) and other than an intermittent rec. problem that goes away after a 5 min. warm up and changing the finals it's been trouble free. Even after I blew the fuse running psk31 with too much power on (lack of attention) and it was the original fuse! So expect a lot of hrs. of use and see you on psk31,feld hell, cw, rtty and even ssb once in a while.
By the way Bill explain the difference in tubes for me if you would. I forget why it matters,
Thanks
Gary wb3dsj

From: Bill K0ZL
Topic: 1083 Message: 1086

The 6146B has 35 watts plate dissipation max, others
are 25 watts max.

Very important for RTTY non-burst modes

Hey Bill,

Great idea on the "cap kit". If you do put it together, add my name
to the list as wanting one! Also if you sourced 6146B's and the
12BY7's I'll bet they would go too.

BTW, thanks for a great group...the hints and tips are great!

73 es have a great 2004.

Topic: 1093 Message: 1093

Wwhen tuning up I get between 110 to 100 watts from the lowest band
to 10metres.
Should tuning up for max out in cw equate to max output on ssb.
Whay I am asking this ,if I follow the tune up procedure according to
the manual for ssb I find the peak output is less than if I Tune up
in cw mode.Then measure peak output in ssb.
Hope this question makes sense.
Regards
Bob/G7JHW

Bill

I just received a TS 520.....it is in excellent condition and seems to work well. The vfo is somewhat erratic between 300 and 450 mhz. I plan to use the procedure you outlined to clean the vfo. Question? Will Deoxit contact cleaner substitute for the Cailube?

I have a 520,820,530,830.and a 930......all in excellent condition. This site is great for trying to keep them in top shape. Thanks to all who post information.

> Hi RayYou have to remove the vfo assembly and clean the sliding contact on the rear of the vfo tuning cap. remove your knob on the front, and the plate with four phillips screws in front. remove the four screws internally that are mounting the VFO to the chassis. Unplug the vfo power (2 pin) and output (rca coax). Carefully wiggle the VFO out from behind the front panel. Remove the cover of the VFO, careful to preserve the spacer washers on the rear stud. Use CAILUBE controls cleaner only, and spray a little on the VFO contact. Plug VFO in again, power up rig (no filaments), turn on the CAL and listen to the markers as you tune from one end of the vfo travel to the other using the stub shaft that the big knob goes on. Turn it back and forth until all markers come in clearly with no "grunge" or jumpiness. While you have the VFO open, resolder the flying leads inside, that go to the tuning coil and the tuning cap. This will "relax" any tension that are on these joints and will reduce temperature drift. Put everything back together and enjoy ten more years together. bill K0ZL

CW output should correspond to peak SSB output. SSB
peaks will actually be a little more (as measured on a
TRUE peak-reading meter or a scope) than on CW due to
power supply sag not being such a factor in SSB.

How are you measuring "peaks"?

Tune up for max smoke in CW mode and then only worry
about getting the ALC meter to kick with the mic gain.

Yes, deoxit will also work. I prefer Cailube if you
can get it; it will last longer but if you are a
non-smoker it should not be an issue.

Thanks for the comments on the group; we have helped
many here. These rigs are too big to ship for simple
problems, that is for sure.

Hi all,

I'm new to this group, glad to find it....

I still have my original novice rig from 1976 a TS 520S ... needs a tuneup!!

recently picked up a TS690S, and a TS830

My question is what equipment should I have to perform at least minimum repairs on these rigs?

Back to reading the mail

Temperature-controlled 25 or 40 watt iron is
mandatory, something with a good stand and 3 wire
grounded plug. Expect to pay 85-180 for one.

Good DVM.. cheapies work fine but if you want
something that will last, any of the Fluke 70 series
is fine.

Bill, Neither one of these products is available locally.....I have
a can of contact cleaner from Radio Shack, will that perform the
same job comparibly? or should I order a can or bottle of Cailube
(which container do you prefer)to be sure the job is done right.

NOTHING is available locally here, either. I order in
everything.

I think the RS cleaner will work. It's really not
that hard to get the VFO out later if you have to
re-do it.

Hello group! I am new to the group and the Keenwood TS-520S. I am having a problem tuning the transmitter. I get through the the initial tuning up to peaking the Drive but when it comes to Plate Tuning I have a problem. I have the mode switch in Tune, Meter in IP, swith to Send and I can't dip - there's nothing there to dip!! I've been reading my manual on CD but haven't got and hints yet. Thanks in advance for any help!

1106. TS 820s - PTT Problem

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-01-10 02:11:11 UTC
From: au20061
Topic: 1106 Message: 1106

I just received an 820 today. It loads up ok and everything seems to be ok with one exception. When I release the PTT mike there is a slight delay(2-3 seconds) before the rig switches to receive. It acts like the vox delay. I know my mike is wired proerly because it works fine with my 520. The vox switch is set on manual.

Any ideas?

You will have to bring three signal outputs for BFO, CAR, and HET from the appropriate points inside to use an aftermarket freq counter. www.aade.com sells counter kits. I use one on my 520S. I think he has instructions on his site for where to pick up the signals. If not, I can point you to the schematics for the correct pickup points. Installing three rca type jacks on the back of the case like on the 520S would be my approach.

Bill

I have the top and bottom covers off. I see the antenna relay on the bottom behind the vfo. Does the relay unit unplug? Does the plastic cover come off so I can clean the contacts? I don't want to force anything and the service manual does give give much information.

Thanks for your help.

I have a 530S and it's doing a great job. I did have to
align it since it hadn't been touched since new. Some bone
head put a switch on the back for "11 meters" so I removed
it. Should give you many years of great service. I would
advise obtaining the service manual. Makes servicing the rig
much easier and it has the parts list.

Tom,
It's been a while since I worked on one of these,
can't remember (I do about 250 rigs a year).

I think it will unplug; then you can carefully pry the
cover off with a small screwdriver.

Then cut small (1/8" x 3/4") strips off a dollar bill
and soak them in contact cleaner; drag the through the
relay contacts, manipulating the relay arm as needed
to get all contact sets.

1118. ts820 relay

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-01-11 05:35:41 UTC
From: kb9wwq@qsl.net
Topic: 1118 Message: 1118

Tom,

Yes, the relays unplug, and the plastic covers can be removed.
There is a small lug on either side of the base that catches
into small holes in the cover. I use a jewelers screwdriver
and carefully lift the edge of the cover over the lugs. Don't
use anything abrasive to clean the contacts. I use a small strip
of paper soaked with alcohol. While you have the relay out, check
the contact resistance. My relay had a bad electrical connection
between one of the center contacts and the connecting pin through
the base that caused a similar problem as you describe. Also,
there are two relays which are the same. The antenna relay is at
the back of the rig. The one you want is the relay near the center.

Bill

I have the top and bottom covers off. I see the antenna relay on the
bottom behind the vfo. Does the relay unit unplug? Does the plastic
cover come off so I can clean the contacts? I don't want to force
anything and the service manual does give give much information.

Thanks for your help.

Thanks Jay

I have the small jewelers screw driver. Now that I know exactly what
I am working with I can pry the cover off with some confidence.

I noticed the relay was made by Omron. Apparently the relay is no
longer made. Does a substitute exist out there? I noticed that Omron
makes a GR2 series that appears to have the same configuration.
Also, has a mod been posted to wire in a substitute relay if needed?

This site is most helpful thanks to Bill.

Tom,

I am several states away from the rig at present and don't remember
who the maker of the relays in my 820 was, but I believe they are a
fairly common base, 4p dt relay. I wouldn't expect it to be too much
trouble to find something else that could be substituted directly.

Not having been a member of the group for very long, I can't comment on
posted modifications. But in the short time I've been here, I've gotten
several good ideas from Bill I didn't even know I needed!

73's, jay

John,

I don't know if anybody will volunteer to sell the cable, but I did manage to find a source for the extremely elusive Hirose 16-pin connectors. They are available for about $11 plus postage from a place outside London that will sell you ONE piece; got mine airmail in about four days.

http://www.electrovalue.co.uk/

The part is Hirose P-1316-CTA. The P-1316-CEA is virtually identical, but the cable exit is via the side of the housing instead of the rear. I don't have the pin-outs for the transverter cables, but maybe somebody else can post those.

73,
Jim

1123. ts 830 transformer

I looking to get my self a spare set of 6146b valves for my ts-530.I
can get them matched.
I can get either w or b types.General Electric 6146b or
some "chinese" 6146b.I think I am tempted to buy the GE ones.#
Can anyone make comments on above please.
Also 12by7a ,which make is recomended,etc.
Any comments will be appreciated.My wife doesnt want me to waste her
money.
Regards
Bob/G7JHW

6146B only, no W please, and GE is fine.

Long term, less expensive solution.

I can run chinese tubes in my radios but I am a tech
and can fix things when they go "plink" and blow the
line fuse.

PS, everyone PLEASE check your line fuse; it MUST be 6
amps for 120v mains!!!

1127. TS-520SE low signal strength

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-01-12 19:46:49 UTC
From: Art Burke
Topic: 1121 Message: 1127

I just received a TS-520SE and have been doing some signal strength comparisons with my TS830 and it seems as though the receiver sensitivity is down somewhat from my TS-830S.

What should I look for?
On 40 meters, they seem to be down about 10 db.

Thanks for the input and help,

Art

Check out the mail rates to some "foreign" countries
from the US:

http://ircalc.usps.gov/

For small stuff you are going to find that it costs
just about as much to Global Express Mail something to
most foreign countries as it does to UPS something
CONUS>

So our world economy becomes smaller...

Share the wealth.

12 dB is roughly 2 s units.

Ignore the meters for a sec...

What does the 520 sound like? Is it pretty close on
band noise, say on 10M?

Check also on 80m. Listen to the band noise on both..
Lots of noise from surrounding homes; see that both
seem to hear about the same level of clicks, buzzes
and broadband computer monitor noise as the other.

If so, it's just a meter thang.

I have never ever replaced a front end transistor in
any of these rigs that helped a sensitivity issue...
it's always been either dirty relay contacts; or a bad
160 meter antenna transformer coil (yes, these are
also used as impedance transformers on all other
bands).

Subject: Re: Equipment necessary??

Temperature-controlled 25 or 40 watt iron is
mandatory, something with a good stand and 3 wire
grounded plug. Expect to pay 85-180 for one.

Good DVM.. cheapies work fine but if you want
something that will last, any of the Fluke 70 series
is fine.

Tom,

In my TS-820S if the AGC switch is in the off position the S-meter is
disabled. Maybe it's the case in your TS-520ES.

From: au20061
Topic: 1118 Message: 1137

I just got the relays cleaned and back in the 820. All seems to be working fine. I followed Bill's instructions using the dollar bill and the deoxit cleaner. The 820 has two identical relays(Omron MH4P). I cleaned them both. Had to be careful taking the plastic cover off but it will come off.

I have spent considerable time looking for a suitable substitute to the MH4P relay. I do have the data sheet on the MH4P if anyone needs it, let me know. NTE makes an R16 series that is physically the same as the MH4P. The NTE number is R16-17D5-12. Tyco makes the R10 series R10-E1X4-V185. Magnecraft makes the class 67 series W67RCSX-7. They all show a mounting stud that the MH4P does not have. You may be able to get them without the stud. The problem I have not resolved is the coil impedance of the MH4P is 300 ohms(plus or minus). The standard impedance of the substitutes I have listed is 185 ohms.The MH4P data sheet identified a 12 volt relay with a 270 ohm impedance. It was listed as a sensitive relay as opposed to the standard 185 ohm resistance. Can anyone comment on what problems this will cause trying a relay with a smaller coil impedance?

What is anybody's experience in trying to find a substitute for the Omron MH4P(no longer made).

Thanks

Tom K4KFN

1138. Another (different) meter question

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-01-16 00:19:54 UTC
From: peninhal
Topic: 1138 Message: 1138

Well, I was "tuning up" my TS-520s for the first time this afternoon, but ran into a question. The meter functions fine for all (IP, Drive, Plate, etc.) and recieves/tranmits fine, but I get no meter reading for ALC adjustment. Could this just be a dirty contact? Or is it more serious and not affecting rx/tx yet? Any comments appreciated.

From: Bill K0ZL
Topic: 1138 Message: 1139

ALC reading depends on the radio developing sufficient
drive to overdrive the grids of the finals, which
causes the tubes to draw grid current. Don't worry,
that's a normal state of affairs for a class AB1 tube
amplifier. But if you don't have enough drive to make
the grids go positive and draw current, there will be
no ALC indication, since that is what it is derived
from. Short answer? Tune up the RF deck.

Greeting,

I found the only difference between the relays in the TS-820 is that the antenna relay has "larger contacts" to handle more current.

I also have been unable to find a replacement for the antenna relay and if you do please let me know.

Hello!
I?m about to purchase a DFC230 frequency controller
for my TS-830S, because
I can?t find any VFO-230 in this art of the world.

I has no manual and it is the first time I know about
it exists. I need any
advise about the DFC230 and some reviews if somebody
knows it.

Thanks in advance and 73

Is there anyway of telling if the finals have been neutralized? I have a chance to buy a used 530, (the only model I don't have) the owner says he put new tubes in it. Maybe I should try neutralizing them again or? How does a rig react out of neutralization.

Thank you all for any suggestions.

1144. Re: [TS-520_820_530_830] Neutralization of finals

From: Bill K0ZL
Topic: 1143 Message: 1144

When tuning, the plate current dips. ON either side of
the dip, the rise should be roughly equal, and
symmetric, same rise on either side. Check on 20M.

Also, into a dummy load, the plate dip will correspond
closely with max RF output in CW mode, max smoke.

When adjusting neutralization, this is what you go
for.

1145. Interfacing TS-520 to MFJ 1275T

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-01-18 19:18:05 UTC
From: Norman Young
Topic: 1145 Message: 1145

OK, I start by admitting that I am not the brightest bulb in the chandelier, but I have a problem that has me stumped!

I have a TS-520 that I am trying to interface with an MFJ 1275T Sound Card Interface. This is the 4 pin model mic connector model. I have been able to get the receive to function FB, but I am having a problem with the transmit. There are a set of seven jumper connections inside the MFJ unit that have to be set to match the mic pin configuration of the particular radio. From the factory, the interface is set to match several different radios including the TS-520S, but not the TS-520. I cannot get it to key the TS-520 using that configuration, and I don't know whether it is because (1) my mic configuration is wrong, or (2) my com port is not talking to the unit.

The manual has a procedure for determining the proper pin configuration for radios not listed, but I have not been able to figure it out. According to the manual, my mic configuration is as follows:

Pin 1 - Mic element center.
Pin 2 - PTT.
Pin 3 - PTT ground.
Pin 4 - Mic element ground.

So, here are my questions:

1. Is the mic configuration of the TS-520 different from the TS-520S?
2. If so, and if you are running the MFJ 1275T, what are the jumper connections for each header? I pride myself in being able to figure these things out on my own, but to my mind, at least, the MFJ manual on how to do this is clear as mud!

Obviously, if the mic configuration is OK, then I need to start looking at the com port on the computer to see whether it is talking to the interface, but I want to make sure I've set up the interface right first.

Any help will be greatly appreciated!

Also, if you can help. please cc me directly as I get the digest only, and if someone knows the answer, I can finish setting this thing up and play a little radio since I have tomorrow off.

Thanks in advance.

73,
Norman

I do not know about this particular set up but when my computer does not key
my radio it usually was because I had not set the com port setting in the
software. Check the settings in your software they may have defaulted to the
wrong com port or may be sent to no com port for use with a vox setting.

G'day boys,

I have a TS-520 SE that sometimes goes dead on me for a few seconds. It's just the receiver, I think. I can be operating fine when suddenly it goes quiet. No receive at all for a few minutes than it suddenly returns to normal. Doesn't do it all the time, just now and then. And usually only once during an operating session.

Could it be a relay that needs cleaning?

From: pscarr@juno.com
Topic: 1147 Message: 1148

Good morning. I have an old TS-520 that is used daily. First, does the RX go completely dead (no audio) or do still get some noise from the speaker? Second, When it happens can you still make transmit carrier?
In the first case, I had a problem with RX audio and it was the earphone jack. I used to leave the earphones plugged in and the jack would go open when on the speaker. Second, it may be the bandswitch. If you can't transmit try turning the bandswitch to both limits, gently, several times and then return to the band of interest. The thread on bandswitches mentioned "Dioxit" as a cure for bad contacts like that.
Hope this helps.

Relay or bad solder joint on the RECT unit.. unplug,
uncover and upend the rig (no alcohol either until you
are done).

make sure all electrolytics are discharged.. use DVM
first, then short to ground, each one of the big ones.

Remove the RECT board, center-rear-underside of the
rig, and resolder all round the rectifier leads where
they go thru the pc board.

While you are there, if your final tubes are in
sockets on a PC board (I think they are on all these
series of radios except the early 520), inspect the PC
board solder joints around the tube sockets. If you
see any one cracked or questionable, resolder them
all. Use a good hot 40w gun and lots of solder; make a
nice convex fillet on each one and you won't have to
do it again. Japan saved much on solder on that board.

I use a DFC-230 with my TS-830s and TS-120s. It plugs directly into the jack on the back of both transceivers.

The DFC-230 will on occasion become unstable when transmitting. This usually occurs in a mobile environment or in one in which the DFC-230 is subjected to high RF levels. This is easily fixed by opening the unit, loosening and then tightening the screws that hold the PC board to the chassis.

The problem can be permanently fixed by

1. removing the screws that hold the PC board to the chassis.

2. removing the PC board and placing toothed washers between the pc board and the chassis.

3. re-install the screws.

This takes a little bit of work, but is worth the trouble.

TNX for the information, will be receiving it in
a few days. Please tell me if you know any internet
source for its user manual, because it comes without
it, and I could only find it`s circuit schematic.

Will pay atention about unstability in the unit.
Thank you so much!! Best 73!!

Ariel, LU4OO

1153. replacement mic

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-01-20 17:20:33 UTC
From: Nigel
Topic: 1153 Message: 1153

can anyone advise me on a
replacement mic for a ts530sp.as i
use the mic rarely i will be quite
happy with a fist mic. but just do
not know where to start.i do a
little ssb work on a 80m club net
and some dx work when i hear a
country that i need. any advice
would be appreciated. would a
astatic teardrop mic be suitable for
the ts530sp. all the best from nigel

1154. HV variations

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-01-20 20:48:16 UTC
From: Wayne & Chris Baker
Topic: 1154 Message: 1154

Hi all
Recently I have been experiencing some difficulties with my TS-820.
The problem started with a decrease in available output power (down to 50-70W max). On checking, both 6146B's appeared to be damaged, with visible perforations in the metal work of the tube. It looks as if the heaters have been running too hot and eaten into the metal!!
Replacement tubes have been obtained and not wishing to have a similar reoccurrence has lead me to undertake some voltage checks.
The finds are what is causing some confusion.
The HV has increased from around 900v to approximately 1040v, the heater volt is about 14.5v.. Most voltages to the other parts of the final board are also high. The higher voltages would appear to be the cause of the tube failure.
My question is does anyone have any thoughts as to why I may be experiencing a steady increase in voltages, or has anyone experienced similar?
Here in VK we run on 240v which did not present any problems until recently. This voltage is reasonably steady.

Thanks in advance.
Wayne

1155. Update to MFJ 1275 and TS-520 Question

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-01-21 04:26:12 UTC
From: Norman Young
Topic: 1155 Message: 1155

Thanks for the input. Just a little update to my question...

After I posted the question, I went searching onlline and found the user manual for the TS-520S, and the mic connections are identical. I also emailed MFJ, and I got the following response from one of the engineers:

***

Dear Sir,

I noticed in the manual that there is no jumper on HD1 which is for CHASSIS GROUND. Being as PTT uses CHASSIS GROUND for closure, there should be a jumper on HD1. Try placing a jumper on Pin 3 of HD1 and try transmitting again.

Please let me know.

Thanks,
MFJ Customer Service

***

I have not had a chance to try this, but if the manual is wrong, it is also wrong for the 520S and the 530, and who knows how many other models... Oh, well, I hope that's it. Should know for sure later in the week when I get time to try it. I'll let you know how it turns out.

As for the com port, I had also suspected that it might be the problem, so before I wrote MFJ, I checked it. Using Digipan, I measured the output voltages at com port 1 to verify that they were what they were supposed to be at pins 4 and 7 to ground (pin 5), in both transmit and receive mode for the software. That checked out OK, so I knew that the software was talking to the right com port.

Thanks again & 73,
Norman

Check the primary taps on the power transformer; the
white wires should be soldered to the 120v terminals.

Hello Wayne,
I have had a similar problem with my TS-820S when operating it on 240 VAC. The final tubes would last from as little as a few weeks to maybe a month with the excessive voltages. My resolution to the problem was to power the rig on 110 VAC.

Hi Group

A funny thing happened while "listening" to a QSO on 80m last night. Smoke billowed from my TS-520S from the area around the 6146B finals. I turned the radio off immediately.

Suspecting a resistor or something had gone open circuit and caused some major damage. I pulled the covers off and removed the cage to the finals. Looking for the obvious burn marks associated with such a catastrophe. Guess what I saw straddling the band switch and chassis?

A cremated Gecko (a type of lizard about 2 1/2" long). I haven't pulled the little fellow out yet because he is wedged well and truly in amongst the finals and I don't want to get cremated either. I will remove him tomorrow with some plastic tweezers.

I don't think that he has caused any major damage because I can not see any burned components and the main fuse was not blown. However, is there anything that I should check before putting the radio back together again and switching the TS-520S on?

Is there likely to have been damage sustained to ANY part of the radio that I should look for?

Just think of what smoked duck would smell like.

As Homer Simpson might say "Mmmmmm, smoked duck"

Good idea to let the rig discharge over night, you might also want to
bleed off HV areas holding a resistor with something insulated,
sometimes it takes a looooooong time for all the caps to discharge.

1161. TS 820 and 820 VFO Question

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-01-22 03:12:17 UTC
From: au20061
Topic: 1161 Message: 1161

I have an 820 vfo connected to my TS 820. The TS-820 will not give up control to the external vfo. When I switch the external vfo on the vfo red light on the rig stays on and the external vfo does not work(red light comes on but it cannot control rig).

I have connected the 820vfo to my 520 and it works perfectly so cable and 820vfo check out fine.

Why is my TS820 not letting the external 820 vfo take over?

Thanks

may be your socket for the vfo on the ts-820 is not correctly wired... if your transceiver is
working fine without a plug inserted into the external vfo socket , the socket wiring is modified... (in many cases is a bride installed to use the transceiver without the external vfo).

Uwe

I will look inside tonight and check the socket. The rig came with the plug to fit in the socket when not using the external vfo. It could still be jumpered. It is an old rig and has probably been in many hands over the years.

Thanks for your suggestion.

It's kind of early in the new year for "year's most
interesting post" award, but Adam appears to have
taken it!

In the States, the gecko is the mascot adopted by one
of our major insurance companies; an entire advert.
campaign has been based on this computer-generated
animal... I hope this does not portend problems for
this company! hi.

Just get all the carbon-based life form pieces out,
you should be fine.

An 830 fried the inside of my arm one time; the radio
sustained no damage.

73,

Bill

Maybe your TS-820 had the "full transceive" modification. The matching R-820 receiver could be used to control the TS-820, but certain mods were required to manage this and I am not sure what effect they have on the regular vfo.

One way to tell is to unscrew the cap on the dummy plug in the VFO socket. If pin 4 is jumpered to pin 7, then this rig likely has the mod I describe.

It sounds like Mr. Gecko completed a circuit that was not supposed to exist and blew his fuse so to speak. If that is all that happened, it is possible, but unlikely, that others things got too screwed up. I have smoked quite a few components in my day with minimal collateral damage.

Might I suggest a well chilled Chardonnay? It goes very well with cheese, shellfish, and grilled gecko.

1167. ts-530 if shift

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-01-22 15:16:30 UTC
From: blobby12uk
Topic: 1167 Message: 1167

Can anyone suggest anything.I soldered in a yk-88sn filter and all works well.
What I have noticed is on usb the signals appear very sharp toneally which can be greatly improved by adjusting the IF slightly to the minus side.This increases the baseyness which I prefer.This effect of sharpness is greater with the narrow filter switched in.
However on lsb the toppyness is not so pronounced so I tend to leave the if shift in the centre.
I have tweaked the if strip according to the service manual which has made no difference apart from increasing the sensitivity of the set slightly.
Am I to think that the kenwood filters have a lob sided pass band or am I missing something?
Do I need to adjust some other part of the set to get the same sound quality for usb and lsb.
The set does tx and rx on the same frequency as displayed.
Regards
Bob/G7JHW

Thank you for the replies.
Running 110V is not really an option here, but still an option.
On inspection the main transformer was still setup for 220V, that has now been corrected to 240V and the voltages are now close to what is expected.
The rig has obviously run in the unmodified setup for many years (rig only acquired about 12 months ago)prior to coming into my possesion. When first obtained the voltages appeared to be ok and only recently have the symptoms arisen. Not sure what caused the change but will keep an eye on things.
Thanks again

Ext VFO depends on the 8v line being switched from
your mode switch to the connector on the back of the
rig. Suspect broken wire somewhere.

You should be able to tweak the heterodyne oscillators
to make USB and LSB sound the same on receive. I don't
have my service manual here to tell you what the
trimmers are.

You will need to balance the balanced modulator after
changing these.

Great.

I would stock up on pair of 6146B, a 12BY7 and the
plate filter caps, just in case things got a little
stressed. You have time to find these parts now that
the rig is working ok.

Yo the Gecko!

Gecko extracted, no mates in there with him thankfully. Everything appeared to be fine visually. Switched on, all works like it is supposed to.

Many thanks to all who replied.

Adam

PS Chardonnay went down well hihi

I dont think the signals are of frequncy it just seems that more of the lsb signal is passing through the filter than does the usb.
"I will try what you suggest but I dont want to cock everything up so I will tread carefully.

You should be able to tweak the heterodyne oscillators
to make USB and LSB sound the same on receive. I don't
have my service manual here to tell you what the
trimmers are.

You will need to balance the balanced modulator after
changing these.

I have just set the usb and lsb crystals on frequency.The usb xt was a bit off and it sounds nice now with if shift in centre for both usb and lsb.Also I followed the service manual and on lsb set tx and rx to same within 20hz.
No doubt I will need to complete a total alignment now I have made some minor adjustments.
Regards
Bob

Thankyou for your comment.Looking at the service info It appears that the if shift adjusts which ever carrier oscillator is switched in .(usb and lsb).I found on checking their frequency that the usb crystal was pretty well on and the usb was way off.I just set the usb xt back on and it sounds pretty much same on usb/lsb with if shift in centre.At moment I am happy.
Im one for dabbling and learning I hope.I rather have my head in an ar88 coms rx.
Regards,thanks for your time to comment.

Hi Bob,

Well, I guess I will start the questions... Has the rig been in storage at all? It kinda sounds like you are getting shorts in the loading capacitor... the spacing on those plates is pretty close, and dust or something similar could be causing little arcs. Has anyone been inside it recently? If those close spaced plates touch momentarily while you are rotating the shaft, you would get something like that... Do you hear any arcing, or smell any ozone being generated? The only "wiper" would be between the capacitor shaft and ground... perhaps there is some grit in there. I would wait for the other more expert opinioins to come in, but a blast of bottled air (computer store stuff) might blow the dust away... and do a visual inspection to see that the plate spacing is not messed up. Or perhaps a little antioxidant contact cleaner on the wiper on the loading capacitor shaft... Also, what kind of coax are you using? Is it possible that there is a breakdown or arc somewhere in
your antenna or feedline system?

regards

Raleigh

G'day All,

I'm new to AR and new to this group and am From Queensland
Australia, will be doing my Novice shortly.
I am awaiting the arrival of my Hf Rig..(in Transit) a TS-530S.
I have just arranged to buy a second hand All band Vertical. 10m-80m.
I'm in an over 50's complex so it's going to be fun getting this 20+
antenna up without conflict.

I am told it has been a one owner until recently (deceased). It
looks brand new and comes with all originalpackaging manuals etc.
I'm looking forward to finding out what mods if any have been done,
and what filters etc. have been fitted.

I have a lot of learning to do, I have gathered all the info on Mods
& repairs I can locate, I have found a TS-530SP owners manual
online, Can someone please tell me what the difference is for
the 'S'&'SP'.

I want to find a Service manual for it.
Also I'm probably looking for a AT-230,VFO-250,SM-220 or Later and a
desk Mike....Wish list..

I have been reviewing the archives here and find this a very usefull
group.. Thanks for letting me join.

Any and all advice, information is welcomed....

Regards
Bob M

G'Day Mate... and welcome aboard...

Visited some of your beautiful country, but further south and also out west...

good luck on the vertical... you will need a good ground screen under it, as well as a good DC ground (8' rods)... I 'scalp' the lawn... down to dirt almost, then lay chicken wire on the ground, pinning it down with aluminum wire pegs... then I bond the edges with acid core solder. (can't get the rosin stuff to stick to the galvanizing).. I also thread a few copper wire radials weaved in and out of the chicken mesh and solder each one in a few places along its length (32 feet or more is what I use for 40 Meters... more for 80..) Then, when all the work is done, I just let the grass grow up through my ground screen... (Set the lawnmower a little higher than usual, until the thatch holds the wire down firmly...), and voila', a good working ground mounted vertical... If you elevate it, of course you will need radials cut to each band you intend to use it on.

Hope to hook up with you on the air one day... I work mostly 40 and 20 meter CW..

regards

I want to find a Service manual for it.
Also I'm probably looking for a AT-230,VFO-250,SM-220 or Later and a
desk Mike....Wish list..

I have been reviewing the archives here and find this a very usefull
group.. Thanks for letting me join.

Any and all advice, information is welcomed....

Regards
Bob M

The 530 is a great radio. Other than a few things
that might need to be addressed, these are very
reliable and chances are good that your new one will
need nothing more than to be fired up into a good
antenna.

Hello to everyone in the group...

Interested in anyone with experience with a TS-530s and SB-200 combination. The keying voltage on the SB-200 looks to be just a little too much for the 530 to handle alone. Hate to add an extra relay to the mix, concerned with the added delay causing the SB-200 to switch with RF already present.

Any comments appreciated...

1192. TS-830S Low Power / Odd ALC Behavior

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-01-26 00:57:35 UTC
From: k7zs
Topic: 1192 Message: 1192

I am hoping to find some help from all you other TS-830S owners out there!

I picked up a TS-830s knowing it had low power output. I have gone through most of the routine checkpoints as provided here and other excellent web sites.

Alas, no changes.

The problem is very low power output, and an ALC Meter that PEGS full scale regardless of the carrier setting.

Today, I started to trace the TX LEVELS chart to see what I could find. Ran into something on my first test point:

On the IF unit, at TP2 (which measures the output of VR4 which along with TC3 adjusts the Carrier Suppressor (Balanced Modulator?) The service manual indicates there should be 10vrms. I do not have an RF probe, but put the oscilloscope at that junction, and witnessed about 3 volts, BUT essentially a half wave form, not a sinusoidal wave.

So, I have 2 questions at this point:

1. Does anybody have any advice regarding the approach to debugging this ALC Meter problem?

2. Is the TP2 value 10vrms, and should it be a sine wave? (and if it is, what is not working to cause half the wave to have disappeared?)

That's probably enough for now.

Thanks, hope somebody can help or point me to reference material, I am determined to learn to service this radio myself!

Yours is perfect.

You don't want to see 900v dropping to 700 or less.

Usually, if one of the HV caps is gone, the HV will
drop to 450 volts or so. No fuses blow, no smoke, just
low output. That's one of the cool things about
voltage doublers; they definitely let you know when
something is wrong without blowing up the world.

Oh also, if you have a bad cap, you will get reports
of "gritty" audio; this will be the 120 Hz ripple
modulating your SSB signal but ONLY on voice peaks,
hence the "grunge" reports rather than "hum", that you
might receive if running CW or AM (that is, if these
rigs could run AM, that's what you would hear; but
they can't, so you don't... but you knew that...)

If the ALC meter is pegged the most likely cause is the rig is
oscillating. There are two sources of feedback that can cause

this: The driver tube and the bandswitch.

Check the tube shield on the 12BY7 driver. I found that mine did not make electrical contact. Touching a screwdriver between the top of the final cage and the driver tube confirmed this. Scraping and cleaning the shield only created a temporary fix. A piece of braid soldered to the top of the shield and attached to a screw on the final cage solved the problem.

There is a ground strap/spring at the point where the bandswitch enters the final cage. Mine was missing. I used a garden variety spring taken from a ball point pen and streched between the two tabs so that it touches the shaft.

G'day Bob, and welcome to the group.

I run a TS-520SE and it's a great rig. I've only been licensed for less than a year and already I can't remember when I made my last SSB QSO; I'm entirely CW now. Although I feed my signals into a 20m dipole on the roof, I am planning to build a magnetic loop soon. This, I am told, is a great stealth antenna that is very quiet. It works fine placed inside the shack at ground level. Bear this in mind if you can't erect that verticle.

Tim, thanks so much for your comments, they are MUCH appreciated!

Following your advice, I checked the 12BY7A shield, and mine has
a 'hairpin' looking wire that contacts the side of the shield. I did
get continuity between the shield and ground, so it is indeed
grounded on my radio.

Second, I checked continuity to ground on the bandswitch shaft. The
spring loaded wire on mine was intact at the PA compartment, as well
as at on the front panel.

Still getting the full scale ALC regardless of carrier setting. Is
there a way to confirm the oscillation any other way?

I am game to try anything else you might suggest

Thanks and 73

Hi Bob

That foil in the roof would make a great ground plane for the vertical....
if the body corporate will let you put it on the roof that is.

BTW there is nothing to say that a dipole or any other wire antenna should
be straight, you can run it anyway you like. Yes there may be some
degradation of the radiation pattern but this may not bother you if you can
work out which way the antenna favors and orient it to your preferred
direction. Just remember to keep the feed point as high as possible.

I use and off centre fed dipole here, and it is in the shape of an over
bent U The legs point south and south west respectively. for 80m and 40m
there is no real change in pattern but on 20m and higher there is a
definite South Westerly benefit.

1201. TS-520SE VFO DRIFT ON POWER UP

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-01-27 20:56:10 UTC
From: wa5jaw
Topic: 1201 Message: 1201

Hello,
I need a little help with my TS-520 internal VFO.
My external VFO is very frequency stable but while switching between internal and external VFOs (both set to same freq and stabilized) I noticed that my internal VFO when switched on starts up about 150-200HZ low and ramps to the orginal set frequency or even higher after about one minute. Watching it (WWV) on MixW in the waterfall you can see a definite ramp. The external VFO when switched on is exactly on frequency and requires no start up time to come to frequency.
Sounds like a lazy oscillator to me, how about some help. Has anyone had such a problem their 520 VFOs?
Thanks for your comments,
Sam WA5JAW

check the dc supply to the VFO, with good DVM, see if
there is a ramp there.

1203. TS-830s w/No Driver Tube, w/Heater OFF, Carrier CCW -FULL ALC???

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-01-28 03:50:28 UTC
From: k7zs
Topic: 1203 Message: 1203

Hello Again. Maybe this will resonate with someone?

Everything in this radio seems right, except for the ALC function (and low power output. New driver tubes coming) Finals will draw 200ma plus adjusting the bias control so finals seem fine)

Just for kicks, thought I would check to see if the ALC FULL SCALE with NO CARRIER would still happen with the driver tube removed, and the heater switch OFF. Carrier all the way off in CW mode.

Yep, ALC meter still pegs on SEND.

Any clues where I should look next?

Thanks!

-Kevin K7ZS

1204. My TS-520

Yahoo group: TS-520_820_530_830 (2001 — 2004)

Topic: 1204 Message: 1204

Hi group. New member here. To make a long story very short, I`ve been sitting on a brand new TS-520 for the last twenty some years. I never have been in a position to set up a ham shack, untill recently. I also have no real HF experience, or any experience at all. Well anyway I have been on a hard core search lately for a new HF rig and the decisions are "killing me". For now I decided to follow the old acronym K.I.S.S. (keep it simple stupid). Why buy a new hf rig when I already own one?
So I have decided to get my TS-520 on the air! To tell you the truth I`m kinda scared of it, tuning procedures and all.
Ya don`t have to do all that with a new radio. Anyway sometime in March I will be moving into a house so I will be trying to get the TS on the air asap.
I do have the original manual that came the radio, so it should be easy to follow the tuning steps?
There are a couple of things that I would really like to find to complete my TS-520 station. Don`t say e bay, I`ve been watching. I would like to find a AT-200 tuner. There is one on ebay right now but it`s in England and it`s called a TRIO kenwood AT-200. What`s a Trio? Does anybody have a better place for me to look for a AT-200? Also would like a CW filter YG-3395C, MC-50 mike. Don`t think I would need it but wouldn`t hesitate to buy a VFO-520 either. I already have the SP-520. I just think it would be great to have the full line of the TS-520 gear.
Hope I don`t sound stupid or sound to pushy. I`m running out of ideas to find the equipment I want, and I ain`t buying no mfj tuner either.LoL ( I might have to) Thanks for any replies and suggestions. 73`s Kyle n0mkh

Kyle...

I will add my 2 cents worth. Go with the 520. The 520 is a great rig and is very forgiving. You will not have any problem learning to tune the transmitter. I would recomend that you go ahead and get a nice tuner to match your antenna. I also like the tuner because you get a positive indication of your output power.....this helps make tuning easier and also helps diagnose antenna or rig problems. I believe you also need a 50 ohm dummy load. This insures you are loading into the proper match and again gives you a good reference to see that all is working as it should.

Use an antenna that is cut to your operating frequency if at all possible. This makes tuning much easier in that you do not need the tuner. If your antenna is not cut to frequency....load your transmitter into the 50 dummy load to full power......then switch to your antenna and adjust the tuner for minimum reflected power. You can then check your swr.....if less than 3 to 1 you should be in good shape. I have used this procedure for years...it is simple and it works.

You have the 520....give it a try.....you can always go to something else if it doesn't work as you would like.

You will need the MC50 mike. There are many listed on ebay....just make sure you are buying from a ham who has a lot of good feedback (selling ham equipment). I have bought tons of equipment on ebay with a 99% satisfaction rate. The AT 200 is a good tuner but you can also use the AT230. Those seem to be more plentiful. I would not worry with the remote vfo yet. Wait till you get comfortable with the rig. Remember, if you go down this road and it doesn't work out to your satisfaction you can probably get rid of the equipment on ebay for about what you have in it. In addition , you will have learned a great deal about ham radio and equipment operation so your effort will be well worth it.

Good Luck...

Kyle, I would start with a resonant antenna, so you
don't need a tuner. Tuners just complicate things,
esp. with tube rigs.

By all means, collect the whole set!

I think you do need a good solid state rig too, one
that is portable for field day or camping and what
not.

Hi all,

Has I start putting my station back together after a 6 year hiatus ...
I've really enjoyed reading the mail on this group .... all sorts of good information shared ...!!!

Now I have a couple questions ....

I would like to pick up a few sets of final tubes & drivers.... what does "matched tubes" signify?

Any reccomendation on a good distributor for these tubes, what brands should I avoid?

I'm looking for a good DVM ... I've always thought the Fluke meters were good quality ...

can anyone reccomend a good model, and where I should buy from.??

Thanks for all comments & replies,

73,

Clint

Well my TS-530S arrived Yesterday, very nice clean unit.

Hmmm ... No Mic.. what the ... (emailed sender forgot to put in box will mail today)

Opened sprayed vary/caps and pots that are accesible with contact cleaner lightly cleaned dusted the inside and removed Fan and lubed and cleaned, Mild soap clean on outside of case... looks like new.

Attached long wire for receive.... worried I'd blow something.. all worked heard Nuthin.... Hmmmm.

Today Took it down the my AR club and we gave it a test.
Everyone liked it's condition. Very impressed even in original Carton etc.

Wired up old mic to plug .... Works ??
Tested ok on receive tried to Transmitt...dah nuthin... Hmmm , grumble look puzzeld. Open case all lookd good, drop botom of case, maybe some hair cracks around the Valve bases... resolder them,'

Hmmm still no good , negative voltage on valve gate..... puzzled looks maybe tubes damaged in transit.... look schematic...Hmmm Switch in line.... ?? Light bulb?? ... remember book saying switch on back turn off for no transmitt,,,,,,,,

Phew.... ok Good now it works..... read book see about switch....:)

Contact made to test rig..... Malooabah Qld to Woollongong NSW.. middle of the day about 1200 Klm's Good for first time..

Good signal and voice both ways... Yahhhhhh....Sigh of releif.

A couple of red faces from AR members... well at least we got to check out the inside tooo.

2 filters. moded for all chanel transmit. all clean and tidy..

Well worth the wait and money..

Regards
Bob M.

Any of the Fluke 70 or 80 series will work fine for
you. I am happy with my 73 and 77 meters, both are
great and seemingly bullet-proof.

GE 6146B are the only way to go. If you can find 4 or
5 NIB or NOS (new in box, or new old stock, i.e.
unused), get them. Don't worry about the matching...
tubes match themselves if you have same manufacturer
in there. They are in parallel, not push-pull so
matching not important.

Just don't mix a used tube with a new one!

12BY7, any manuf, prefer GE, used OK as long as the
output holds up. Get several; if you find one that is
unstable, dont' toss it.. save for another rig, may
work just fine.

Great, congratulations.

Yes the SG switch is a great "grandkids" switch...
Turn it off and they won't fry your finals by leaving
the rig in TX mode when you aren't looking.

The SG circuit can be re-wired to allow QRP operation,
so that instead of shutting the finals clear off, it
cuts your output down somewhat, say to 3-5 watts.

Topic: 1213 Message: 1213

hi kyle,

Good idea to keep what you have, you can always move up to a newer radio should your needs change, the 520 is also a great radio for backup use.

Did you know you can setup a search in ebay to email you if an item you are looking for shows up ? I've gotten all my geat that way and sold some things to pay for it all too.

Another place to look is http://www.arrl.org has classifieds (arrl member only can post) but anyone can read the ads.

http://www.qth.com and http://www.eham.net also great places to research the things you need.

The vfo is nice, if you like to work split or contests it is good to have.

Just keep looking, you may find one or two items that are local to you for easy pickup.

For tuneup, don't worry, just photocopy page # 22 in the manual and keep it handy.

Drive plate load easy to remember and do be sure to have a good dummy load,
that makes a big difference on tuneups.

I am sure others in the group will pass on additional info.

Has anyone tried using a heathkit sb-610 or sb-614 with a 520 or 830?

I have a offer for a free 610 that works and a 614 not working.

Just wonder if a 100 mile drive is worth it.

Thanks for any comments.

Tom

Thanks adam,
I'm looking at dipols but in a slightly different way..

What if I were to run the wires along the Ridge caping tiles.

I have two options one is in an L at 45-315deg magnetic then 2nd
leg at 315 deg end 225 - 135deg magnetic.

17mtrs
_______ NNE
| x
8mtrs |
| x is aprox location of rig in house.
ESE
I may be able to extend each leg by 2-21/2mtrs running down the
45deg Hip slope ____ at the end of each run.
\
\

Then I would be able to Silicon the Coax to the ridge caping then
run the feed in under a tile through the foil down to my rig with a
swr/tuner.

Has anyone tried this before??

If you have foil under the tiles this will not work. The antenna has to be away from metal.

Can you put it up under an eave, or along a (non-metallic) wall?

It involves re-routing the wire on the SG switch that goes to the -110volt dc supply to the 250 volt screen supply; need to use a 2 watt potentiometer to get just the right voltage on the screens, then you sub a fixed 5 watts resistor voltage divider.

Don't have the exact wiring, it's been a while.

To get QRP you can also "fool" the external ALC input to the rig (that would come from an amp) with a 9 volt battery and a pot, to reduce power.

1221. RE: [TS-520_820_530_830] Digest Number 312

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-01-29 20:41:20 UTC
From: Dave Greene
Topic: 1221 Message: 1221

I think I may have kind of a similar problem.

I have a TS 830S (bought it new and it is unmodofied and never serviced).

When transmitting in "Tune" position, it puts out much less power than it used to, now registering only 1 or 2 watts peak on my MFJ tuner into the dummy load.

On the same tuner meter though, it still puts out plenty of power once fully tuned, either into the dummy load, or into the tuned up antenna I'm using attached to the MFJ. Both CW and SSB are over 100 watts in peak or average meter settings, which as far as I can remember, is the same it has always put out on that meter, even before the "Tune" power output dropped.

I do not recall a sudden drop in Tune power output, it apparently has been sneaking down lower and lowe ron me over the years. I still get great audio "Kenwood-Like-Audio" audio reports, so it seems to be functioning well.

What could cause this symptom?

Subject: Re: TS-830s w/No Driver Tube, w/Heater OFF, Carrier CCW -FULL ALC???

Guessing leaky capacitor coming of the grid circuit,
perhaps.

remind me to look at my schems when I get home today..

Hey All,

I'm looking to buy the external VFO for my 830S. Is the VFO230 the correct one? If so, how much would a functioning VFO230, with interface cable, be worth?

Thanks to Kyle, I am now thinking about expanding my old 830 which will cause the table in my shack to sag even more in the middle.

k0zl <coorsbill@...>

1224. Re: [TS-520_820_530_830] New file uploaded to TS-520_820_530_830

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-01-30 11:46:46 UTC
From: Bill K0ZL
Topic: 262 Message: 1224

Thanks James, nice drawing!

I have converted it to .JPG and uploaded it to the group FILES section under MODS.

73,

Bill

1225. TS-830S Scanned Schematic that is readable?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-01-31 07:48:20 UTC
From: k7zs
Topic: 1225 Message: 1225

Hello Group

Well, it wasn't worth the wait! The Service Manual on CD-ROM for the TS-830 from www.thecdguyz.com arrived today. The schematic is so poorly scanned that the critical reason for having it from service manual compared to the users manual is lost. The voltage check values for the transceiver are illegible. The schematic in the file section here is better, but still inadequate.

Has anybody had personal experience with W7FG's hard copy of the TS-830 service manual? It seems that 1 (mediocre) scan has propogated across the entire internet, and nobody has taken the time to do it right?

Anybody willing to scan just the schematic in the highest resolution possible and send it to me, or post it for the group??? I would be grateful!

Thanks and 73

-Kevin K7ZS

1226. RE: [TS-520_820_530_830] Digest Number 312

Yahoo group: TS-520_820_530_830 (2001 — 2004)

Dave,

Yes the 230 is the correct one for the TS-830S. I purchased mine about two years ago for $250.00. I LOVE IT!!!

Subject: RE: [TS-520_820_530_830] Digest Number 312

Hey All,

I'm looking to buy the external VFO for my 830S. Is the VFO230 the correct
one? If so, how much would a functioning VFO230, with interface cable, be
worth?

Thanks to Kyle, I am now thinking about expanding my old 830 which will
cause the table in my shack to sag even more in the middle.

Dave WW0W

I don't know if my last post made it; yahoo very flaky today.

Schematic is being scanned now and I will put it up on RUBE, our FTP server. They are too large to send via email.

Please join this group to learn about RUBE and how to use it:

http://groups.yahoo.com/group/HAMFTP/

thanks

Hello Group

Well, it wasn't worth the wait! The Service Manual on CD-ROM for the TS-830 from www.thecdguyz.com arrived today. The schematic is so poorly scanned that the critical reason for having it from service manual compared to the users manual is lost. The voltage check values for the transceiver are illegible. The schematic in the file section here is better, but still inadequate.

Has anybody had personal experience with W7FG's hard copy of the TS-830 service manual? It seems that 1 (mediocre) scan has propogated across the entire internet, and nobody has taken the time to do it right?

Anybody willing to scan just the schematic in the highest resolution possible and send it to me, or post it for the group??? I would be grateful!

Thanks and 73

Kevin,

If you don't get a decent scan, I would definitely recommend a copy of the service manual from the ManualMan. His copies are always excellent - he takes a lot of pride in producing a reproduction manual that is every bit as good as the original. http://www.manualman.com

1230. TS-830S Scanned Schematic READABLE - YES!

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-01 04:10:42 UTC
From: k7zs
Topic: 1225 Message: 1230

Bill, it is GREAT. I keep a computer on the workbench for looking things up etc., so with this you can zero in on what you want, it's in color (much easier to read). Thanks!

Printing it out on 8.5 x 11, though, pretty much destroys all that beautiful detail (at least it did on my old HP Laserjet).

Thanks for stepping up and doing this for the group!

73 Kevin K7ZS

p.s. I am certain it was not possible to scan the entire thing into one file, but if so for my purposes to be able to scroll through the entire thing would be great. I might try one of the 'stitching' programs to take these 4 files and make it into one super schematic!

If it works, I will post it to the HAMFTP group.

Bill,
I checked the 9VDC PS and when first turned on it reads 8.98V and after about and hour plus it reads 9.01V. In the process I did find a bad cable connecting the VFO-520S to the rig. Worst solder job I have ever seen!! Anyway I cleaned the rig and plugs on external VFO connection (dummy plug now inserted) and internal VFO connections and reassembled. The rig drifts down about 500HZ in the first hour of operation (after 1 min at turn on) and now in hour 3 it is still drifting down at 100HZ per 30 minutes. Guess that is within specs? Suppose in 4 or 5 hours it will stop going down? Anyway, I can set the rig on WWV at 15MHZ monitoring on MixW (waterfall) and it draws a straight line (assuming drift mentioned earlier). If I switch the function switch to Fix R and disconnect the 9V via that switch for 15 seconds and switch it back to VFO it is 100 HZ low, 30 seconds and it is 150HZ low (after returning to VFO it takes 1 min or longer for Rig to get back to frequency. Tried yesterday switching VFO on and off and the PS voltage remained constant. Looks like something is warming up and changing in the VFO. (External VFO does not do this!)
Well, comments would be appreciated.
Sam Allen WA5JAW

1233. ts520s cleaning/lube ..etc

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-01 19:42:25 UTC
From: taephono
Topic: 1233 Message: 1233

This probably has been covered previously, but I don't seem to find a faq.
I'm looking for some general info on what connections/etc should be cleaned & lubed on a TS520s, this is my orig rig from 1977..getting up there in age, and nothing has been gone over or replaced previously, so I think before I put it on the air again I need to do some basic maintenaince on it ... any pointers/areas I should look at and pay attention to?
All info much appreciated.

73,
Clint

1234. TS830s extension feet?

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-01 22:28:29 UTC
From: taephono
Topic: 1234 Message: 1234

Anyone have some extra of these or know where I can pickup
replacement feet for an 830s,
also extension front feet?

73,
Clint

1235. RE: [TS-520_820_530_830] Digest Number 315

Yahoo group: TS-520_820_530_830 (2001 — 2004)

From: Dave Greene
Topic: 1235 Message: 1235

Hi,

I just bought an old Heathkit SB-200 off eBay. I've never used an amp before.

Has anyone out there driven an SB-200 with a TS-830S? If so, how hard can I safely drive the linear from the 830 since 830's put out over 100W (the listed input for the SB-200 is 100W). Also, how exactly do I connect the ALC and relay connections up (where do I get connectors, cables, etc.??)

Also, how do I connect a scope to monitor the output of the linear for clipping, etc.??

On a seperate note, what type of connector is the external speaker conenctor on the back of an 830S? Where can I obtain one, and what is the impedance of that output?

tnx/Dave

1236. Re: [TS-520_820_530_830] Re: TS-520SE VFO DRIFT ON POWER UP

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-02 13:46:18 UTC
From: Bill K0ZL
Topic: 1201 Message: 1236

Don't know if the VFO has a temp compensating scheme, as in the FT-101, have never had to use it. This amt of drift that you mention is uncharacteristic. Did you clean the wiper on the VFO cap?

Also try re-soldering the connections (any other than the PC board connections) inside the VFO to "relax" the wire tension. I have used this several times and gotten big improvements in the Swan, Heathkit and Yaesu VFOs.

b

wa5jaw <allensa03@...> wrote:
Bill,
I checked the 9VDC PS and when first turned on it reads 8.98V and after about and hour plus it reads 9.01V. In the process I did find a bad cable connecting the VFO-520S to the rig. Worst solder job I have ever seen!! Anyway I cleaned the rig and plugs on external VFO connection (dummy plug now inserted) and internal VFO connections and reassembled. The rig drifts down about 500HZ in the first hour of operation (after 1 min at turn on) and now in hour 3 it is still drifting down at 100HZ per 30 minutes. Guess that is within specs? Suppose in 4 or 5 hours it will stop going down? Anyway, I can set the rig on WWV at 15MHZ monitoring on MixW (waterfall) and it draws a straight line (assuming drift mentioned earlier). If I switch the function switch to Fix R and disconnect the 9V via that switch for 15 seconds and switch it back to VFO it is 100 HZ low, 30 seconds and it is 150HZ low (after returning to VFO it takes 1 min or longer for Rig to get back to frequency. Tried yesterday switching VFO on and off and the PS voltage remained constant. Looks like something is warming up and changing in the VFO. (External VFO does not do this!)
Well, comments would be appreciated.
Sam Allen WA5JAW

clint, put a drop of oil on the VFO shaft; blow out the PA cage with some compressed air, and remove the fan and inject couple of drops-worth of oil into the bearing oil holes on each end of the rotor housing... that's about it.

If you have noisy controls, use some Cailube or DeOxIt but only on the controls that need it.

If your VFO is smoothly tuning the entire band (any band; use the CAL on a dummy load to hear it better), then don't mess with it.

Bill,
I have an external VFO that appears not to have the drift problem. I will test it out completely and replace the internal VFO with the external VFO. I can then take my seeet time and analyze the drifting unit at my leasure. I have cleaned the wipers on both the internal and external VFO tuning caps and I will check all the solder joints.

Thanks,
Sam WA5JAW

OK Sam.

Might be a bad FET also! Those things can act like
parametric amps if they were fabbed wrong.

1241. RE: [TS-520_820_530_830] Digest Number 315

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-03 03:27:27 UTC
From: Bill K0ZL
Topic: 1235 Message: 1241

You have to wire a cable between the AUX connector on
the back of the 830 to the RCA "relay" or "PTT"
connector on the back of the amp. This is to key the
amp when the rig is keyed. The RCA connector for the
amp end is a run of the mill audio type connector. I
usually take a cheap Rat Shack patch cable for stereos
and whack off one end; They also sell coaxial cable
with pigtails on one end and the RCA plug on the
other. If you get a two-headed one, 12' long you cut
it in half and you have a spare for a friend.

Don't worry about the ALC connection for now.

The ext speaker jack is standard 1/8" mono mini plug;
cables for this are also at Rat Shack, already made
up.

1242. 500v electrolytics

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-03 06:42:04 UTC
From: blobby12uk
Topic: 1242 Message: 1242

I am aware of digikey who supply a suitable replacement for the voltage doubler electrolytics for the ts-530.The problem is there handling fee and postage charge is 2 to 3 times greater than the cost of the two components I require.This makes purchase from the UK to expensive.
Cornel dubiler produce suitable types but cant find a suplier in the uk.There are other makes also but cant find a supplier that stocks them.
Does any one know of a supplier who can sell a small number without having to incur an excessive handling charge.Obviously postage charge is fine.From my interenet searchs it does appear that I am most likely to find what I require from the States,but havent yet.
The caps have to be 32mm in diameter approx.
I have read somewhere a member of this group may start suppling a capacitor kit to replace the potentially dodgy electrolytics.
Can any one help.
Regards

1243. TS-520 & MFJ 1275 - One Problem Solved...

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-03 14:10:25 UTC
From: norman_y
Topic: 1243 Message: 1243

A while back I posted a question about using the MFJ 1275T sound card interface
with a TS-520. You may recall that this interface was set up to work with a number
of Kenwood radios with 4 pin mic connectors as set from the factory. One of those
listed was the TS-520S.

I had assumed that the setup for my TS-520 would be the same, but that was apparently
not the case. Anyway, the manual was a little short on guidance for working out
the jumper configuration for 4 pin mics (although it included this info for 8 pin
connectors). After studying this for a bit, I thought I might be able to work it
out on my own, but I did not want to fry something in the process.

Fortunately, MFJ tech support was quick to respond with the following jumper configurations:

Setup #1 Setup #2 Setup #3

HD1 Pin 3 HD1 Pin 4 HD1 No Jumper
HD2 Pin 4 HD2 Pin 3 HD2 Pin 4
HD3 Pins 3 & 4 HD3 Pins 3 & 4 HD3 Pins 3 & 4
HD4 Pin 1 HD4 Pin 1 HD4 Pin 1
HD5 Pin 7 HD5 Pin 7 HD5 Pin 7
HD6 Pin 7 HD6 Pin 7 HD6 Pin 7
HD7 Pin 1 HD7 Pin 1 HD7 Pin 1

All three seem to work equally well, but I settled on setup #3 because it does not
require a jumper on HD1, and the manual says not to jumper HD1. Anyway, I offer
the above FWIW, in case anyone picks up one of these units and wants to interface
it to the TS-520, since it ain't in the book.

I have already made a couple of PSK contacts, and I still need to do a little tweaking
of my input and output. In connection with that, I have another question for the
group, but I'll save that for a separate post.

1244. TS-520 & MFJ 1275 - ... But Another Problem Yet To Be Solved

Yahoo group: TS-520_820_530_830 (2001 — 2004)
Date: 2004-02-03 14:13:44 UTC
From: norman_y
Topic: 1244 Message: 1244

In my last post (assuming you got to the end of it), I said I had another interface
question. I know several of you are active on PSK, and this is not a hardware specific
question (or at least I don't think it is).

I am running a TS-520 interfaced to a 133 Mhz Pentium computer with the MFJ 1275T.

When I am running either Digipan or MixW, from time to time the waterfall will suddenly
have a number of parallel vertical bars on either side of the active stations.
When they appear, they appear suddenly on the display as if a bunch of stations
all started transmitting at the same time. They usually appear as faint blue, like
really weak stations, unless they are near a strong station. Then they will appear
as lighter yellow bars on either side of the active station.

When this happens everything is garbled, but they go away in a matter of 10-15 seconds.
I cannot tie them to any directly observable event such as an active hard drive
or a change in the audio level heard from the radio. Nor does it seem to correlate
with the computer input audio level. This is seen on all bands, and is subject
to happen at any time of day or night. It is not seen at regular intervals, but
I would say it happens every 3-5 minutes or so.

Things I can't rule out:

1. I know that the 133 Mhz machine is about the lower end of what will work with
these packages, but I am not running anything else in the background (other than
what Windows 98 might be doing), so there should not be any memory problem. Then
again...

2. The soundcard. I have no idea what kind it is, but it seems to work OK reading
CW, but there is this problem with PSK.

3. The radio itself. I can't hear any change in audio, but maybe something is
going on there.

4. External interference. I have tried turning everything off that might be an
interference source, but nothing seems to matter. If it is something external,
I have not been able to locate it. And if so, it is intermittent.

I've done a lot of looking on the net, but I have not seen anything quite like this.
It does not prevent me from working PSK, but it does present a challenge when I
miss something in the middle of a QSO, so I'd like to ID and correct the problem.
I do have another faster computer that I can interface with if I have to, but I'd
like to be sure that it is the computer before I do. This machine is too convenient.

Anyone ever experience anything like this, and if so, any suggestions?

Thanks,
Norman

From: wa5jaw
Topic: 1201 Message: 1245

Bill,
Hooked up the external VFO on the test bench last nite and it was very-very stable. I could disconnect it from 9VDC for 2 minutes and reconnect and the frequency would only change about 2 HZ. It stabilized in 5 minutes or less. Is the Osc FET available or is there a substitute you would recommend to replace it?
Thanks,
Sam

1246. RE: [TS-520_820_530_830] Digest Number 317

Bill,

I just found the following Heath SB-200 bulletin at
http://www.qsl.net/kb7rgg/heath/Service_Bulletins/sb200.txt.

Considering the date, does this apply to the 830 and 830S as well?

Dave

April 6, 1984
SB-200 Bulletin No:
1 KW Linear Amplifier SB-200-9

Interfacing The Linear To Kenwood Exciters

The ALC voltage to Kenwood transceivers and transmitters should not
exceed -8 volts. To Ensure the proper voltage to the Kenwood, add:

An 8 volt zener diode [PN 56-621] across the ALC connector on the back of
the amplifier. Connect the banded end of the diode to the ground lug.

Adding a control in the ALC line (as instructed in previous bulletins) to
control the level of ALC voltage doesn't always work. This control loads
the ALC line so much that very little ALC voltage is developed, resulting
in the exiter overdriving the linear, In units which have the control
installed and the operation is still unsatisfactory, return the ALC
circuit to its original design and install the zener diode.

I can get these for you, as I have to order some from
Digikey anyway.

Contact me off list with quantity, shipping address
etc and I will tell you the cost.

Norman,
Glad you were able to work it out. Sorry we weren't
more help but this apparently was a combination of
equipment that no one else here has, or was unable to
decipher for you.

Thanks for sharing the solution with us.

You can try switching to dummy load real fast, or
removing the antenna coax, see if it changes.

That's a 3SK22, dual gate FET, you can use a 40673
there, or 3SK40.

If you are referring to the ALC voltage limit, yes.

However, I never use the ALC hookup on my amps... see
Measures on that, the ALC attack time is not fast
enough to prevent splatter.

With the exception of the AL-811 (3 tube 811 amp,
needs only 65 watts drive), none of the newer amps
need ALC input from your rig to function well.

Watch your grid current when tuning up; properly
loaded, the grid current will 'tell' you how much PEP
you can feed the amp without overdriving it.

For what it's worth Sam, this is a known characteristic of the Hybrid Kenwood rigs (520,530,820,830). The VFO-230 is also known to be dead on from a cold start. To make you feel a little better, my 830 does the same thing (200 Hz low, then it gradually drifts up to the warm frequency and stays rock solid after that all day long). There is a mod in which you can put a large value resistor across the AC line to keep the rig warm even when powered down. This minimizes the drift, but I don't think it is worth doing.

1254. Transistor Substitutions

Yahoo group: TS-520_820_530_830 (2001 — 2004)

I am (trying) to debug and repair a TS-830s with low power output. I I have discovered a few transistors that have failed, and of course you don't easily (or inexpensively!) replace these with the exact parts, due to their vintage.

I have 2 questions for the group:

1. Are modern equivalents acceptable? NTE for example?

2. Has anyone ever seen a transistor / diode cross reference specifically for the TS-830S? Would save a lot of internet searching for datasheets etc.

I am just curious, as my first few replacements with NTE equivalents only created more problems - very disappointing!

I am chasing an ALC problem, specifically I am replacing on the IF Unit: Q30 and Q31 and on the AF unit, Q19 and Q20.

Any tips here?

Thanks

Thankyou for the help....
I presume the part Digi-Key part number p7453-nd will be the best fit for ts-530/830 etc.
I will only require two as spares for my radio.The ones in my set are still ok.It is just an insurance policy.
The shipping address is England.Presumably I could send you American dollars to cover all costs.I have done that recently with no problems.
(Find my details on QRZ.COM under G7JHW)

I can get these for you, as I have to order some from
Digikey anyway.

Contact me off list with quantity, shipping address
etc and I will tell you the cost.

Good idea. That could possibly eliminate the radio as the culprit.
I am also looking into the possibility that I don't have the mic
